

# Water-related issues affecting conventional oil and gas recovery and potential oil shale development in the Uinta Basin, Utah

PI: Michael D. Vanden Berg

DOE number: NT0005671

Project website: [geology.utah.gov/emp/UBwater\\_study](http://geology.utah.gov/emp/UBwater_study)

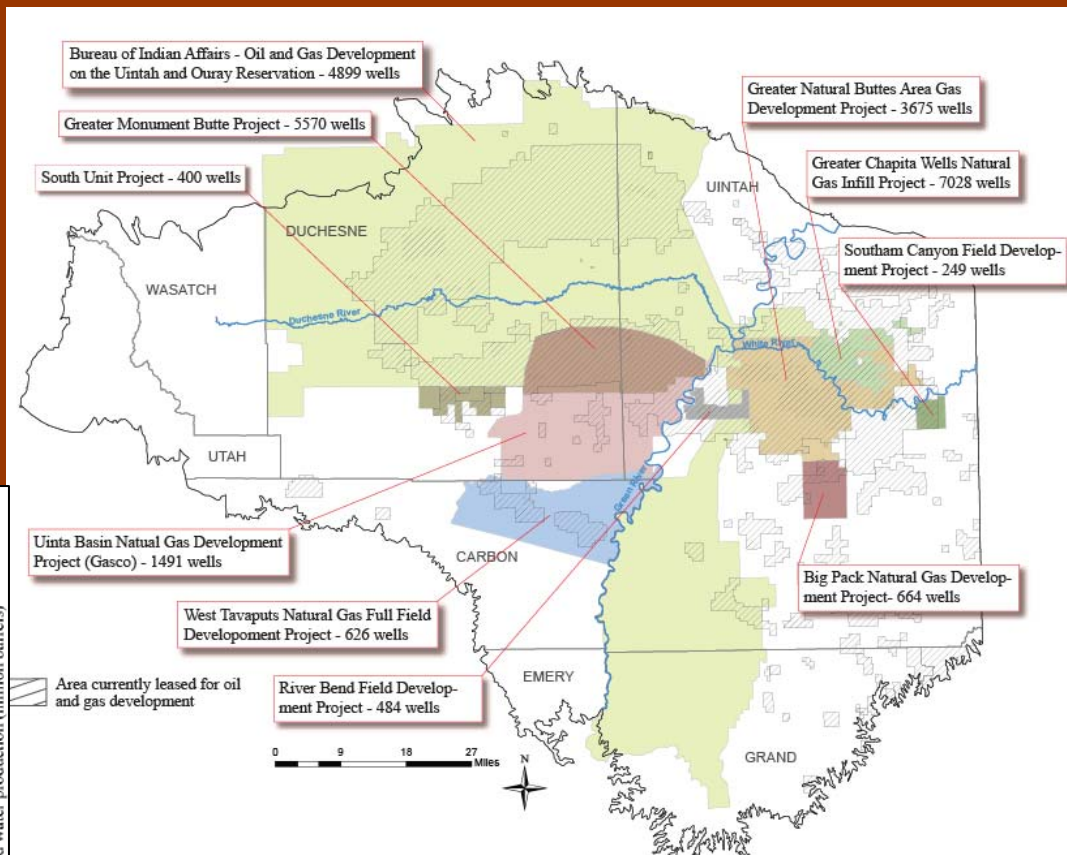

[www.geology.utah.gov](http://www.geology.utah.gov)

## Overall Goal #1

### Assess groundwater aquifers in the Uinta Basin to help facilitate prudent saline water disposal

- Facilitate increased petroleum development
- Protect freshwater resources
- Reduce the need for evaporation ponds

**Natural gas, crude oil, and water production in the Uinta Basin, Utah, 2002-2011**

More than 25,000 oil and gas wells are currently proposed for drilling in the Uinta Basin

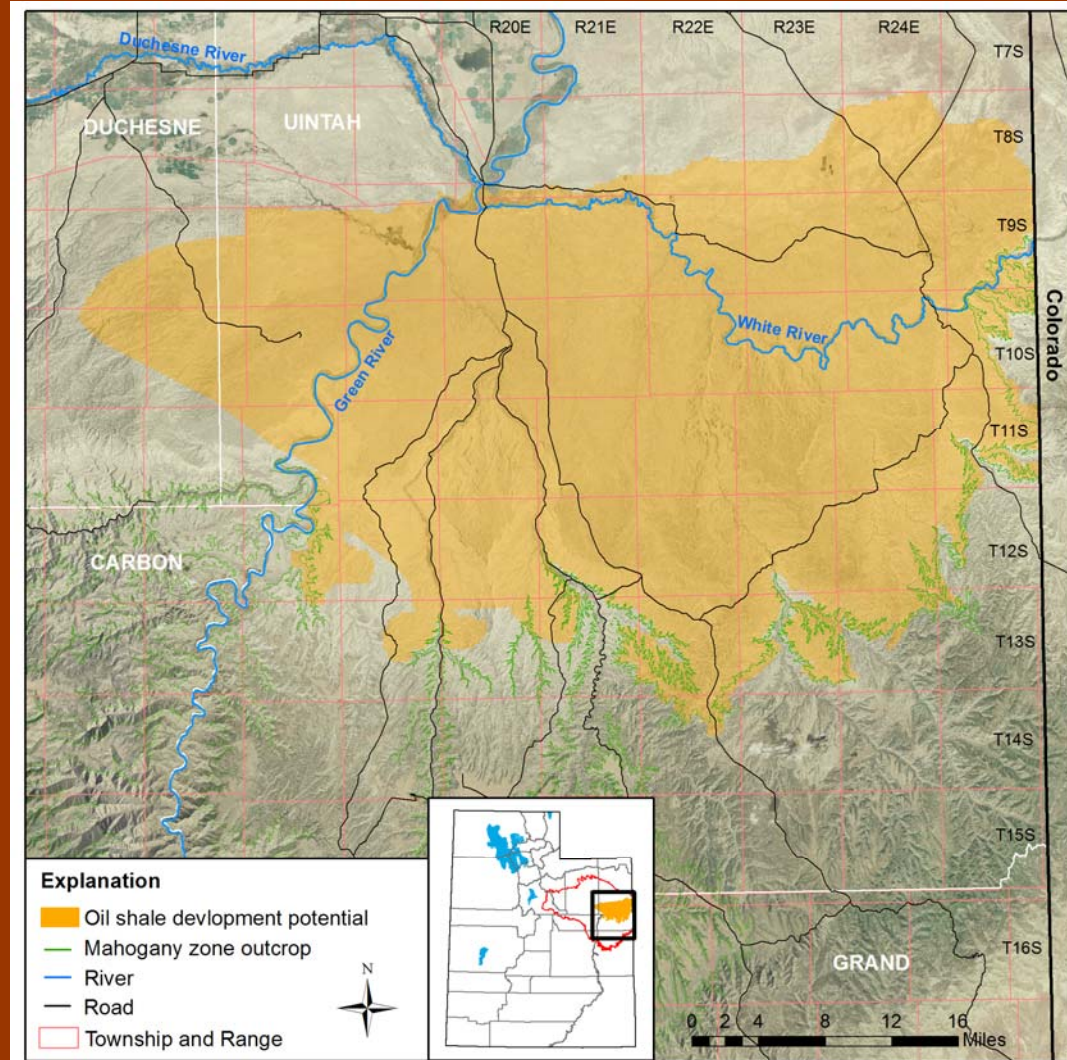

This future drilling will greatly increase the amount of produced water needing proper disposal

# Overall Goal #2

**Establish baseline surface and shallow groundwater chemistry data for lands with oil shale development potential**

- Lands designated by BLM in PEIS
- Pre-development data
- Bi-annual sampling

# 3 Main Tasks

**Task 1: Project Management – PI: Michael Vanden Berg, UGS**

**Task 2: Re-map the base of the moderately saline water**

Task Leader: Paul Anderson, Consulting Geologist

Scale: Basin-wide

**Task 3: Geologic characterization of the Birds Nest aquifer**

Task Leader: Michael Vanden Berg, UGS, Energy and Minerals Program

Scale: Regional (central Uintah County)

**Task 4: Baseline water chemistry database for lands with oil shale development potential**

Task Leader: Janae Wallace, UGS, Groundwater Program

Scale: Regional (central Uintah County)

**Task 5: Analysis of produced water from simulated in-situ oil shale extraction technologies - Collaboration with University of Utah**

**Task 6: Technology Transfer**

# Project Funding and Deadlines

## **Total Funding = \$860,279**

- 20% UGS cost share
- \$243,966 subcontract to Paul Anderson (Task 2) (billed out)
- ~\$32,000 remaining (to be spent January-April 2012)

## **Timeline:**

- Original time frame: October 1, 2008 to September 30, 2011
- First no-cost extension: Extended project to December 31, 2011
- Second no-cost extension: Extended project to April 30, 2012

## **Task updates:**

- Task 2 – draft final report finished, in review
- Task 3 – draft final report 25% finished
- Task 4 – draft final report finished, in review
- Task 5 – experiments completed, report in prep.

# Task 2:

## Mapping the base of the moderately saline water in the Uinta Basin, Utah

### Problem:

A lack of saline water disposal options is a significant limiting factor with regard to increases in oil and gas production in the Uinta Basin, Utah

- Saline water from oil and gas wells can only be injected into aquifers containing water that is  $>10,000$  TDS salinity
  - Protection of “freshwater” (0-10,000 TDS) is a priority
- Current disposal wells are at or near capacity
- Evaporation ponds can not handle the increase in saline water and pose several environmental challenges
  - Brine concentration
  - Potential for contaminating shallow groundwater
  - Wildlife hazard
  - Potential for increased ozone and VOC emissions
- Re-using water is an option, but treatment is expensive
- Quality groundwater data is lacking, delaying approval of disposal permits
  - Original reference map is 25 years old -  $>8000$  wells have been drilled since

## **Solution:**

Provide reliable and accurate groundwater data to operators and regulators to facilitate prudent saline water disposal plans

## **Research / Deliverables:**

- New GIS-based map showing the base of the moderately saline water within the Uinta Basin, Utah (10,000 TDS surface)
  - Below which, saline water can be injected without compromising “freshwater” resources
- Database of water quality information (ground truth)
  - ~2800 water analyses from ~1500 individual wells throughout the basin
- Five geologic cross sections showing the saline water transition and its relationship to the subsurface geology

### Collaboration – The key to our success!!!

#### Operator / Service Company:

- Alta-Blue
- Anadarko Petroleum Corp.
- Anschutz
- Berry Petroleum Co.
- Bill Barrett Corp.
- Blue Tip Castlegate Inc.
- Devon Energy Production Co.
- El Paso E&P Co.
- Elk Resources
- Enduring Resources
- EOG Resources
- FMIL Natural Resources
- Flying J
- Forest Oil Corp.
- GASCO Inc.
- Halliburton
- JW Operating
- McElvin Oil & Gas
- Mustang Fuel Corp.
- Newfield Production Corp.
- Pendragon Energy Partners
- Questar Energy Co.
- Robert L. Bayless Production
- Rosewood Resources
- Royale Energy Inc.
- Summit Operating
- TCC Royalty Corp.
- Whiting Oil & Gas Corp.
- Wind River Resources Corp.
- XTO Energy Inc.

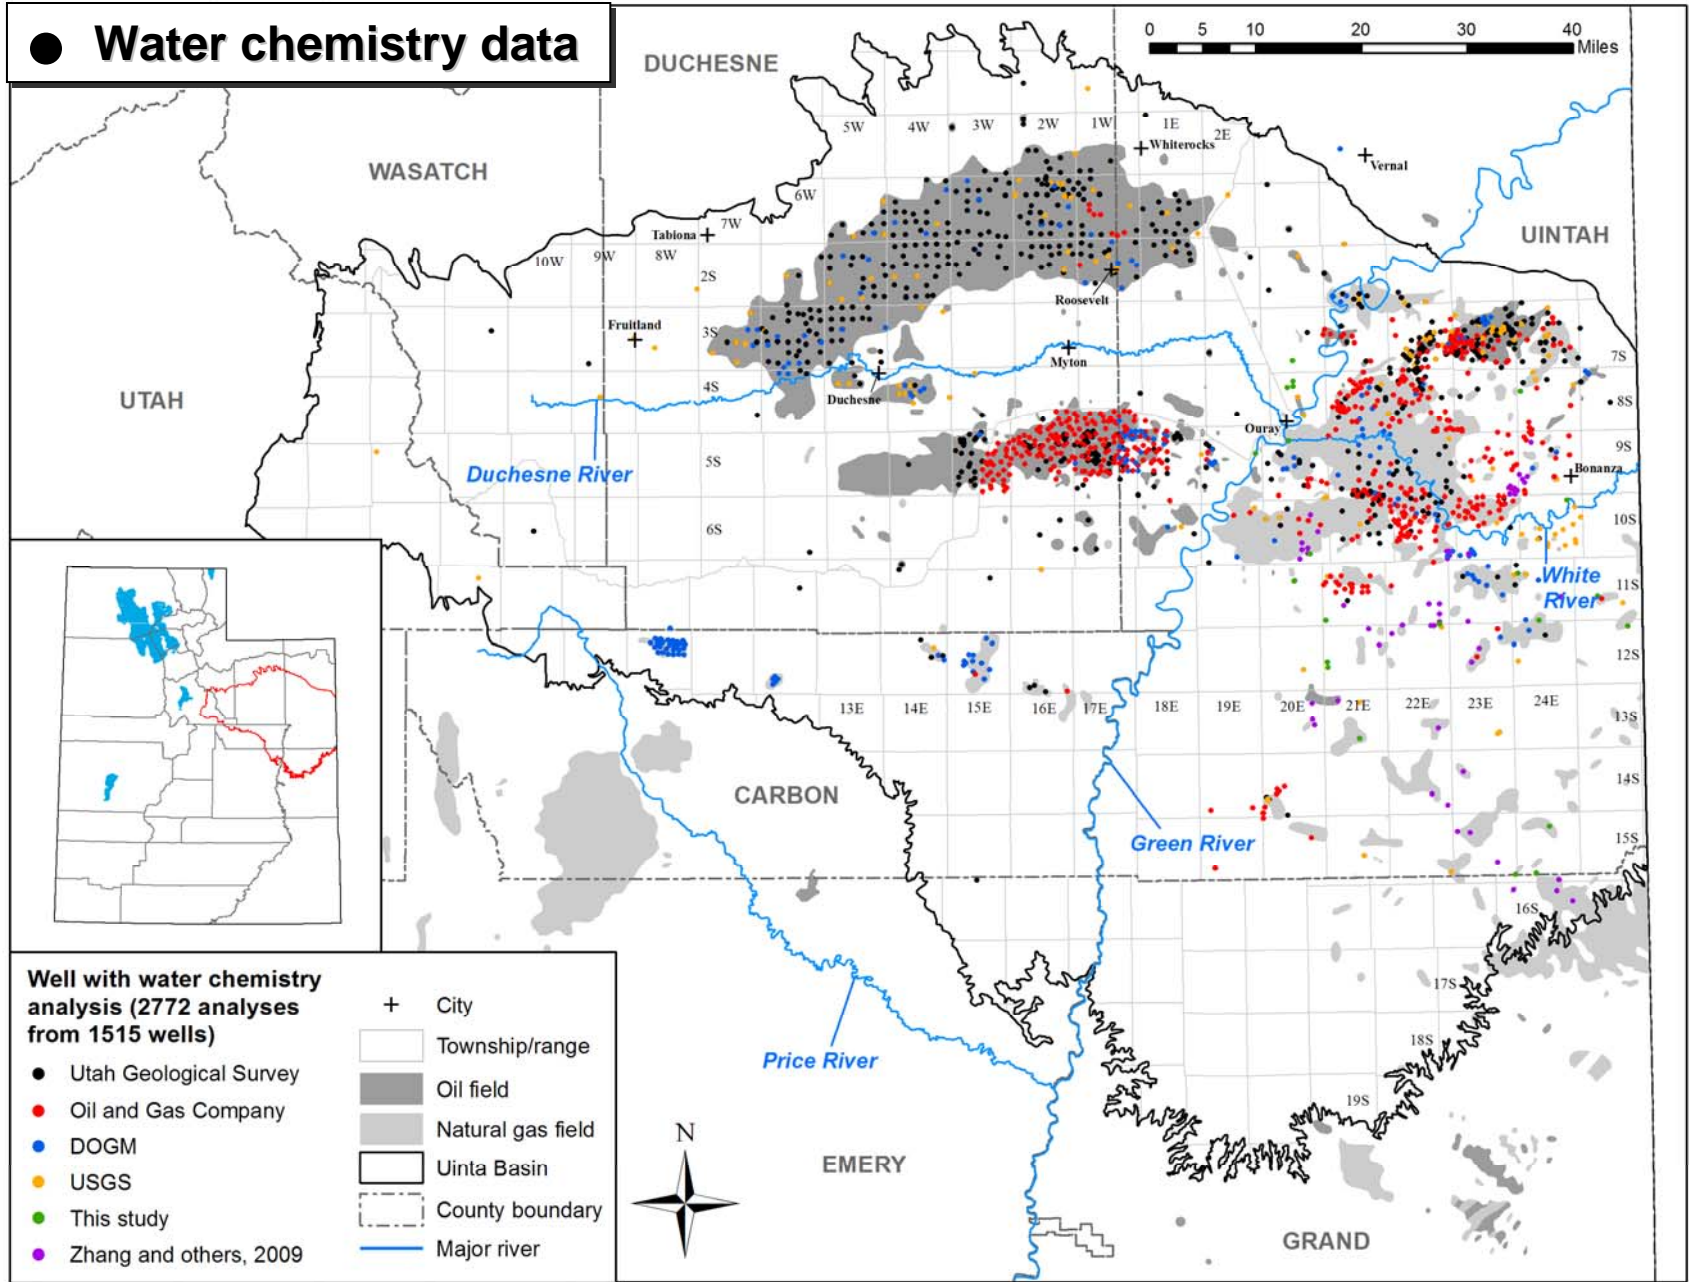

#### Government / Academia:

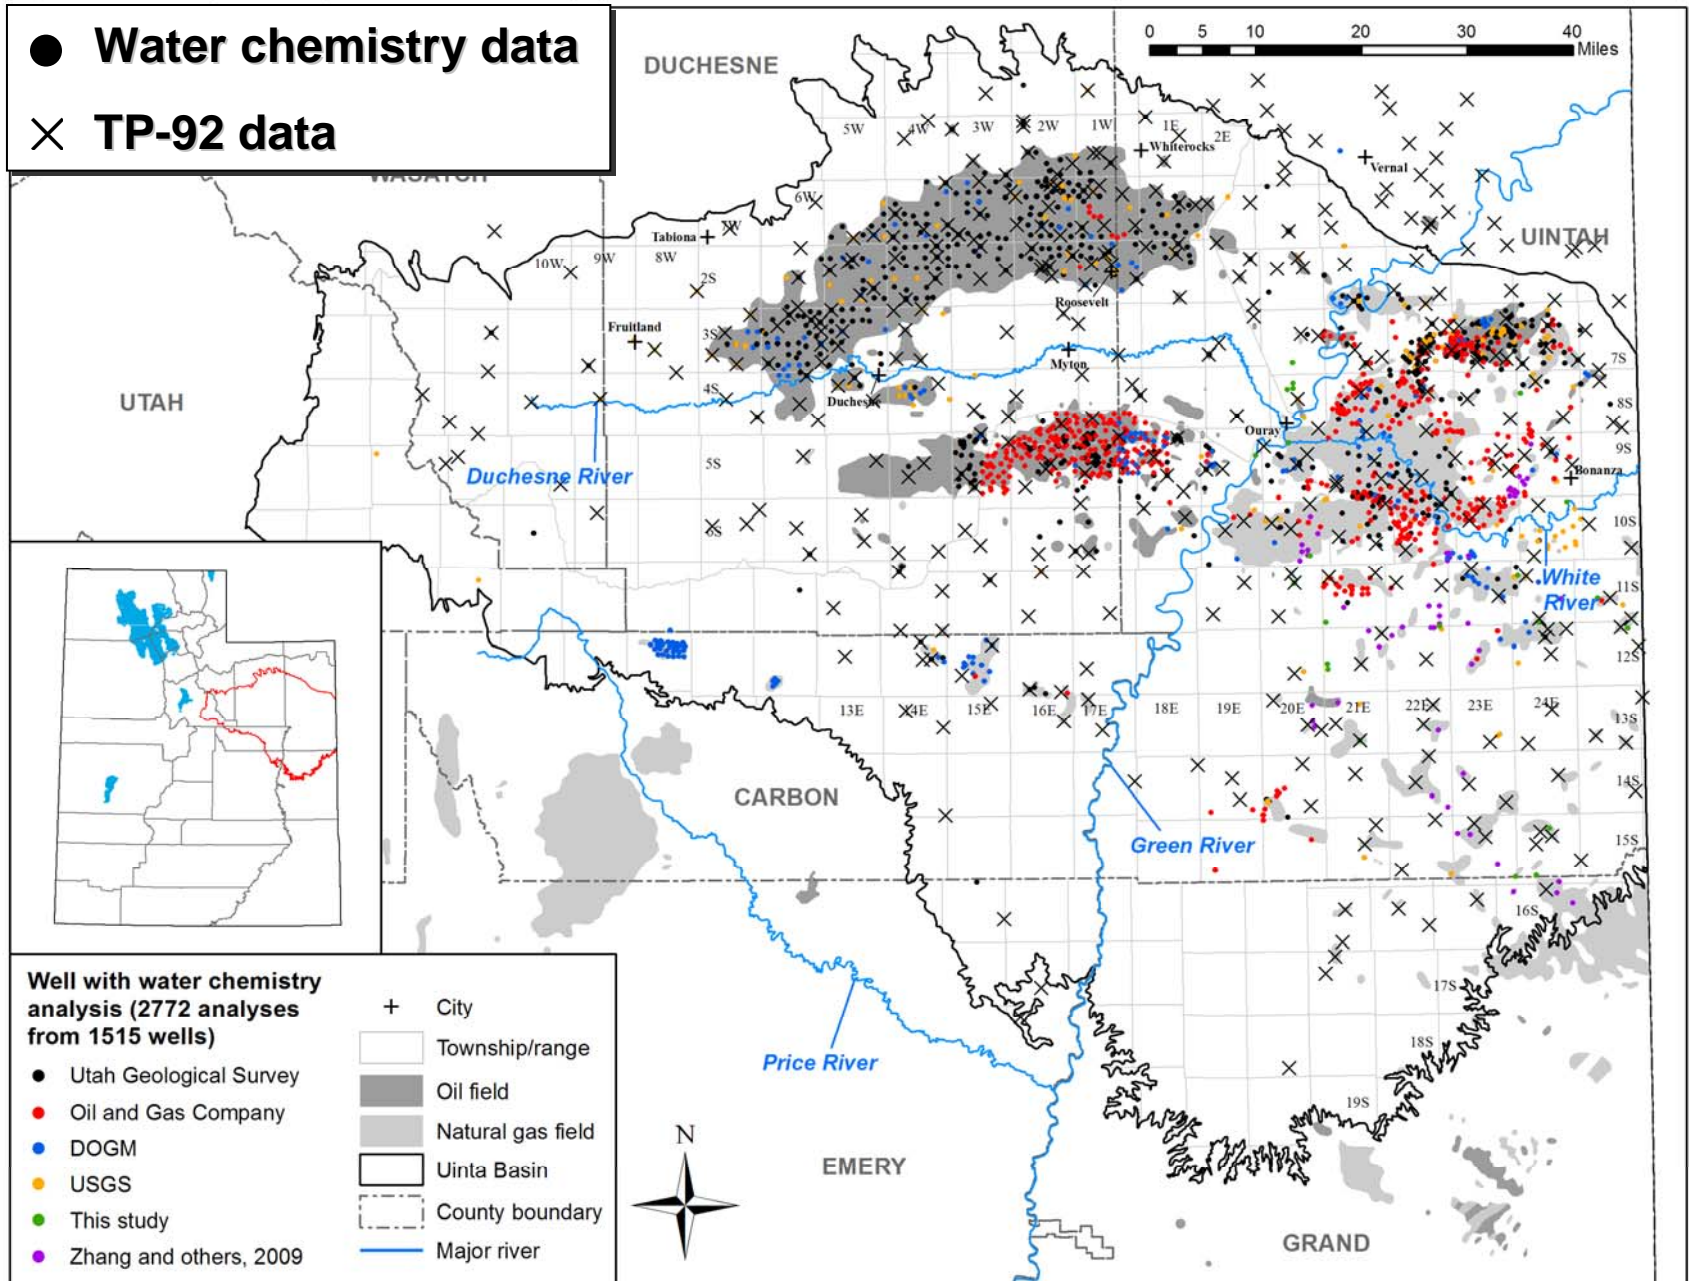

- Kansas Geological Survey
- University of Utah
- University of Wyoming
- U.S. Geological Survey
- U.S. Bureau of Land Management
- Utah Division of Oil, Gas, and Mining
- Utah Division of Water Resources

### Datasets used in mapping effort:

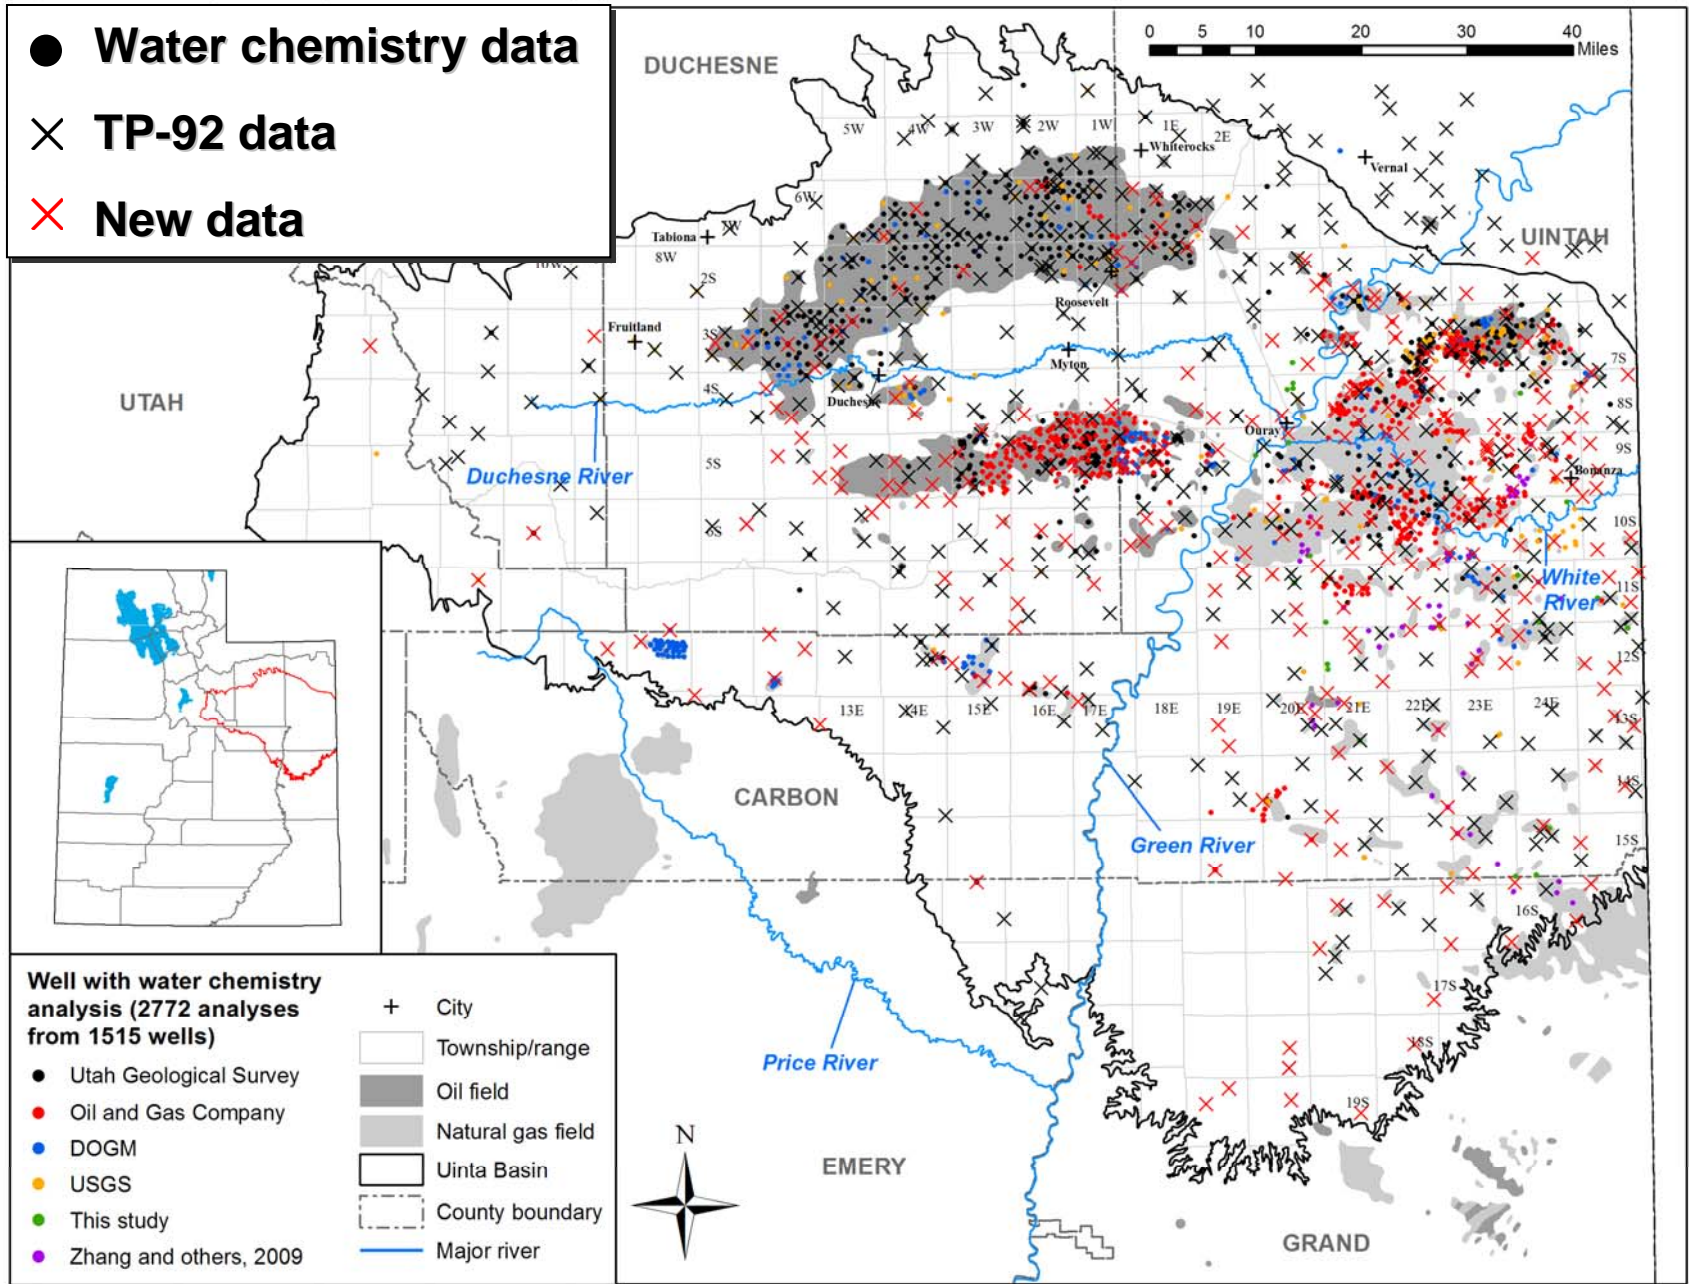

- Downhole water chemistry
  - “Ground truth”
  - ~2800 analyses from ~1500 different wells
  - Data mostly from oil and gas operators and DOGM well files
- Data from original mapping effort (TP-92)
  - This data was re-evaluated and corrections where made when appropriate
  - Revised mapping rules applied
- Evaluation of geophysical logs from select wells throughout the basin
  - 259 wells were examined
  - Examination of resistivity logs as a proxy for salinity (Archie’s equation)
  - Digital log files were donated by companies (70%), the remainder were purchased or digitized in-house

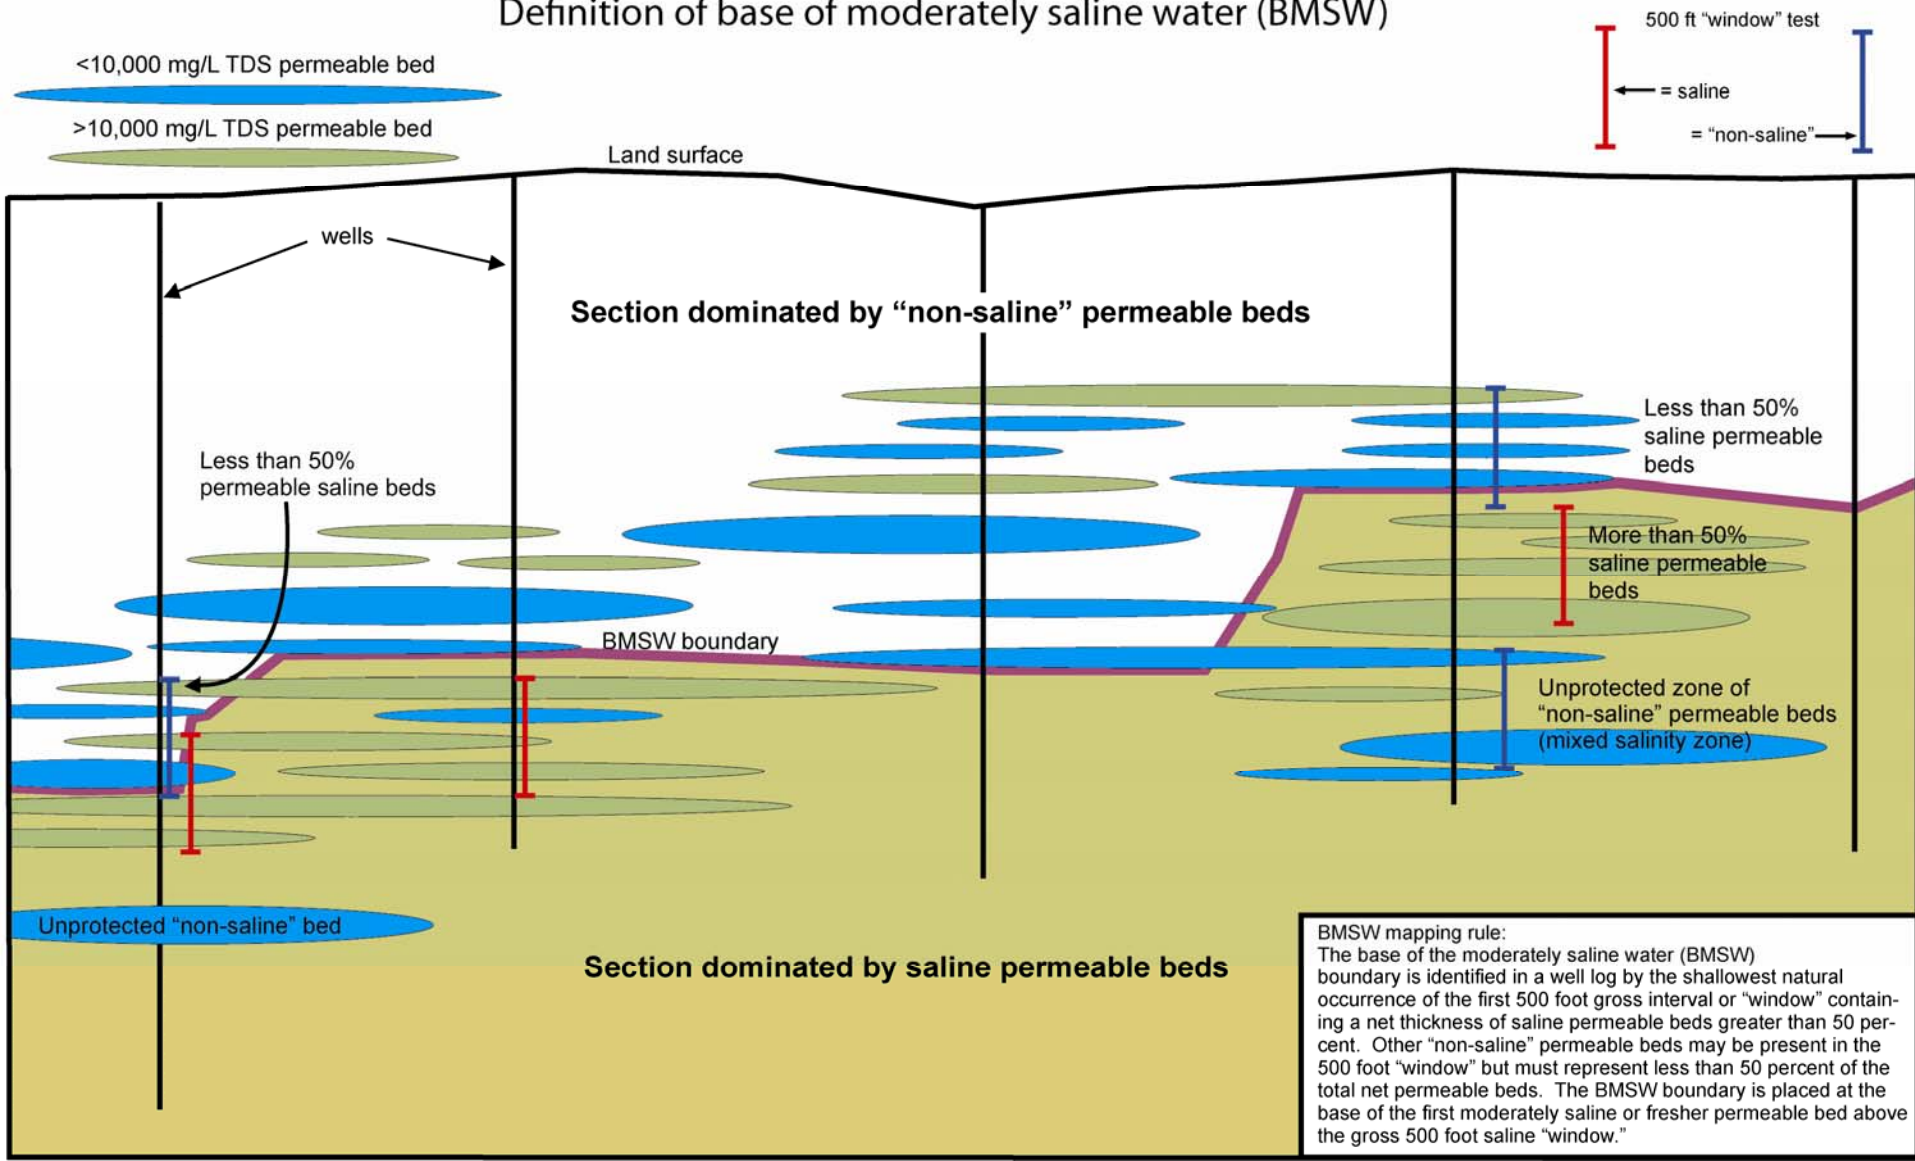

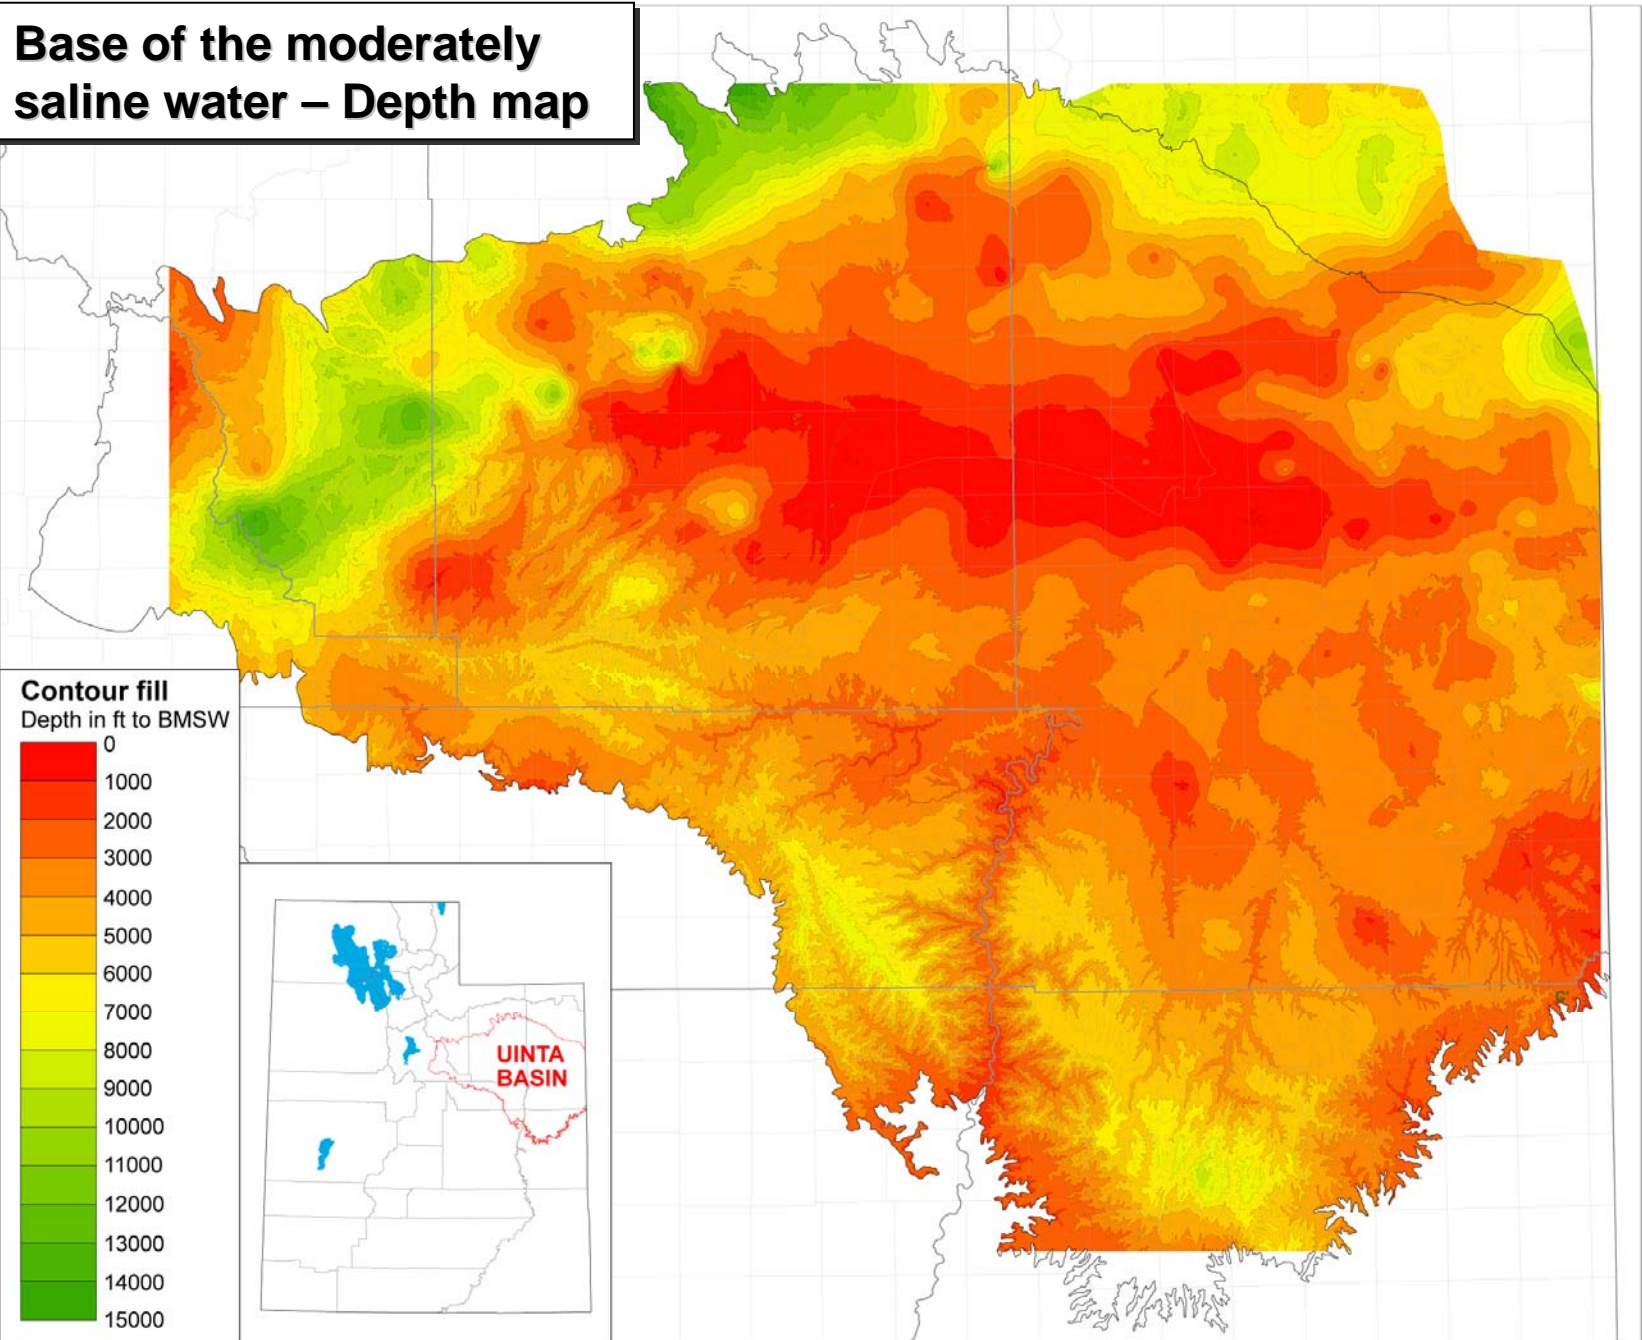

### How do you pick one boundary in a transition zone?

#### Definition of base of moderately saline water (BMSW)

Base of the moderately  
saline water – Depth map

Contour fill  
Depth in ft to BMSW

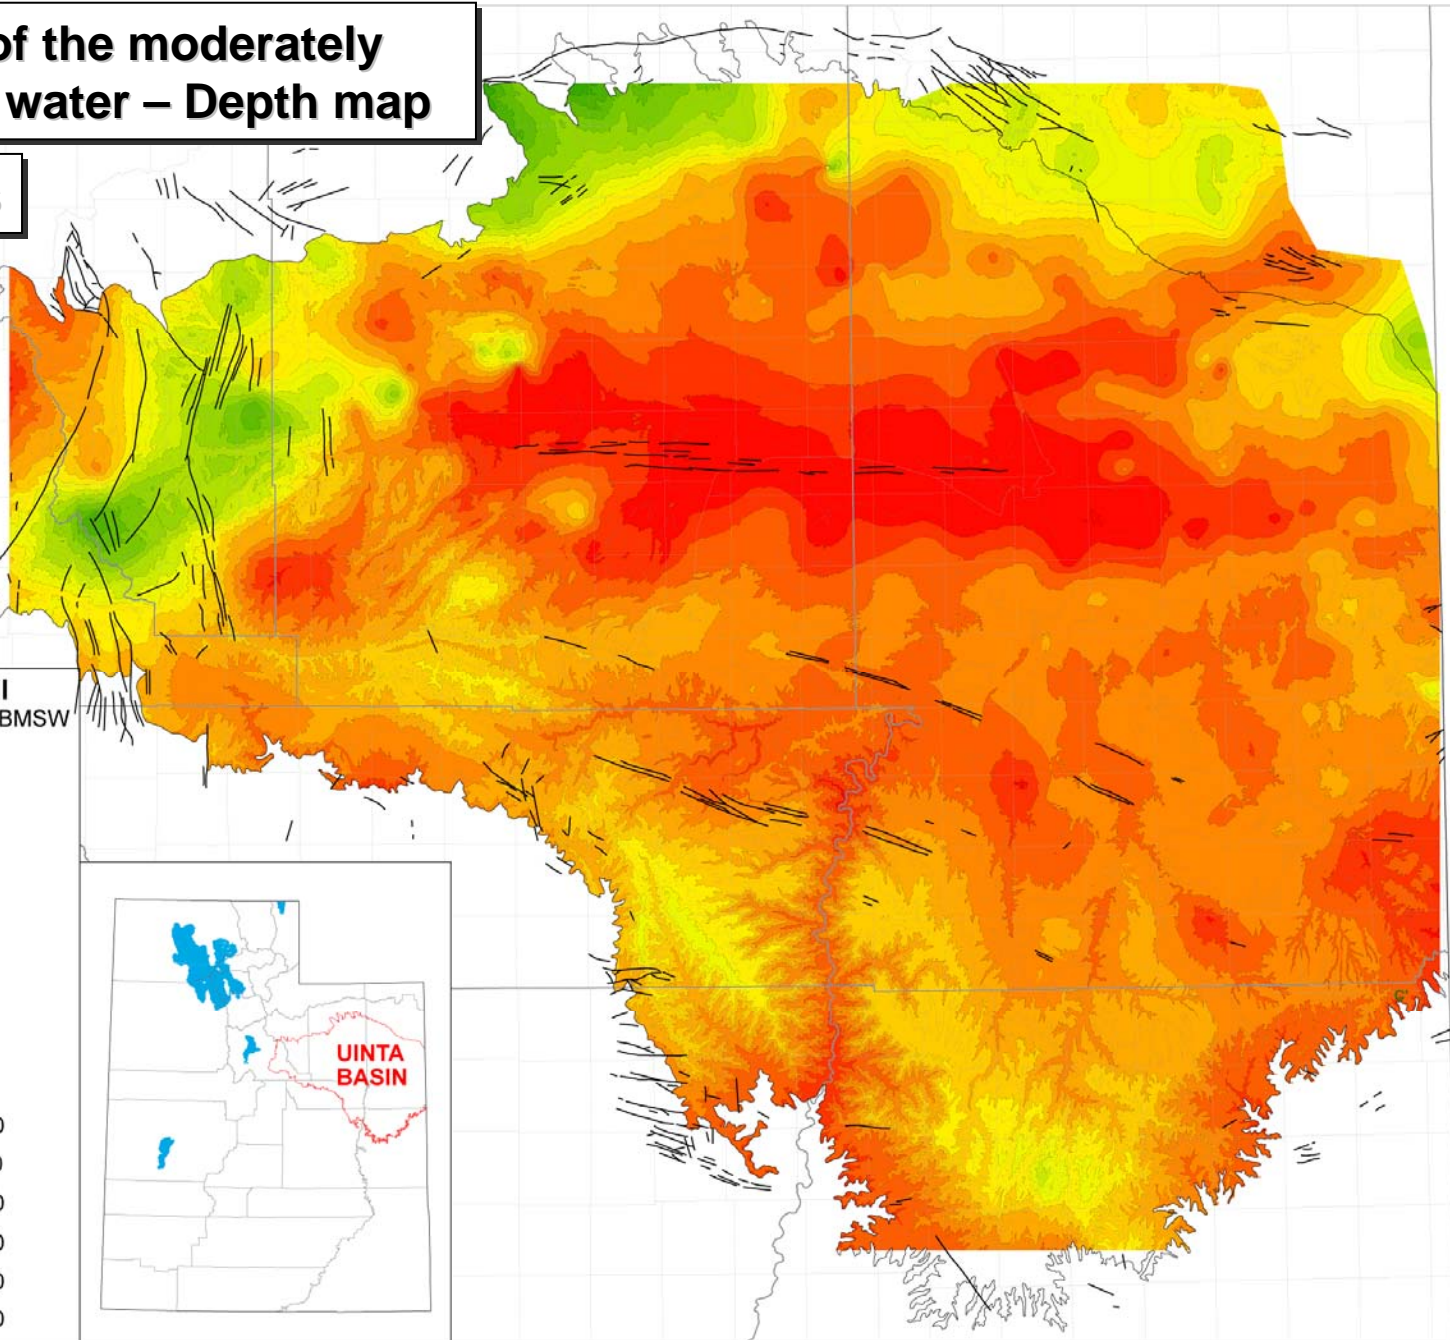

Base of the moderately saline water – Depth map

Faults

Contour fill

Depth in ft to BMSW

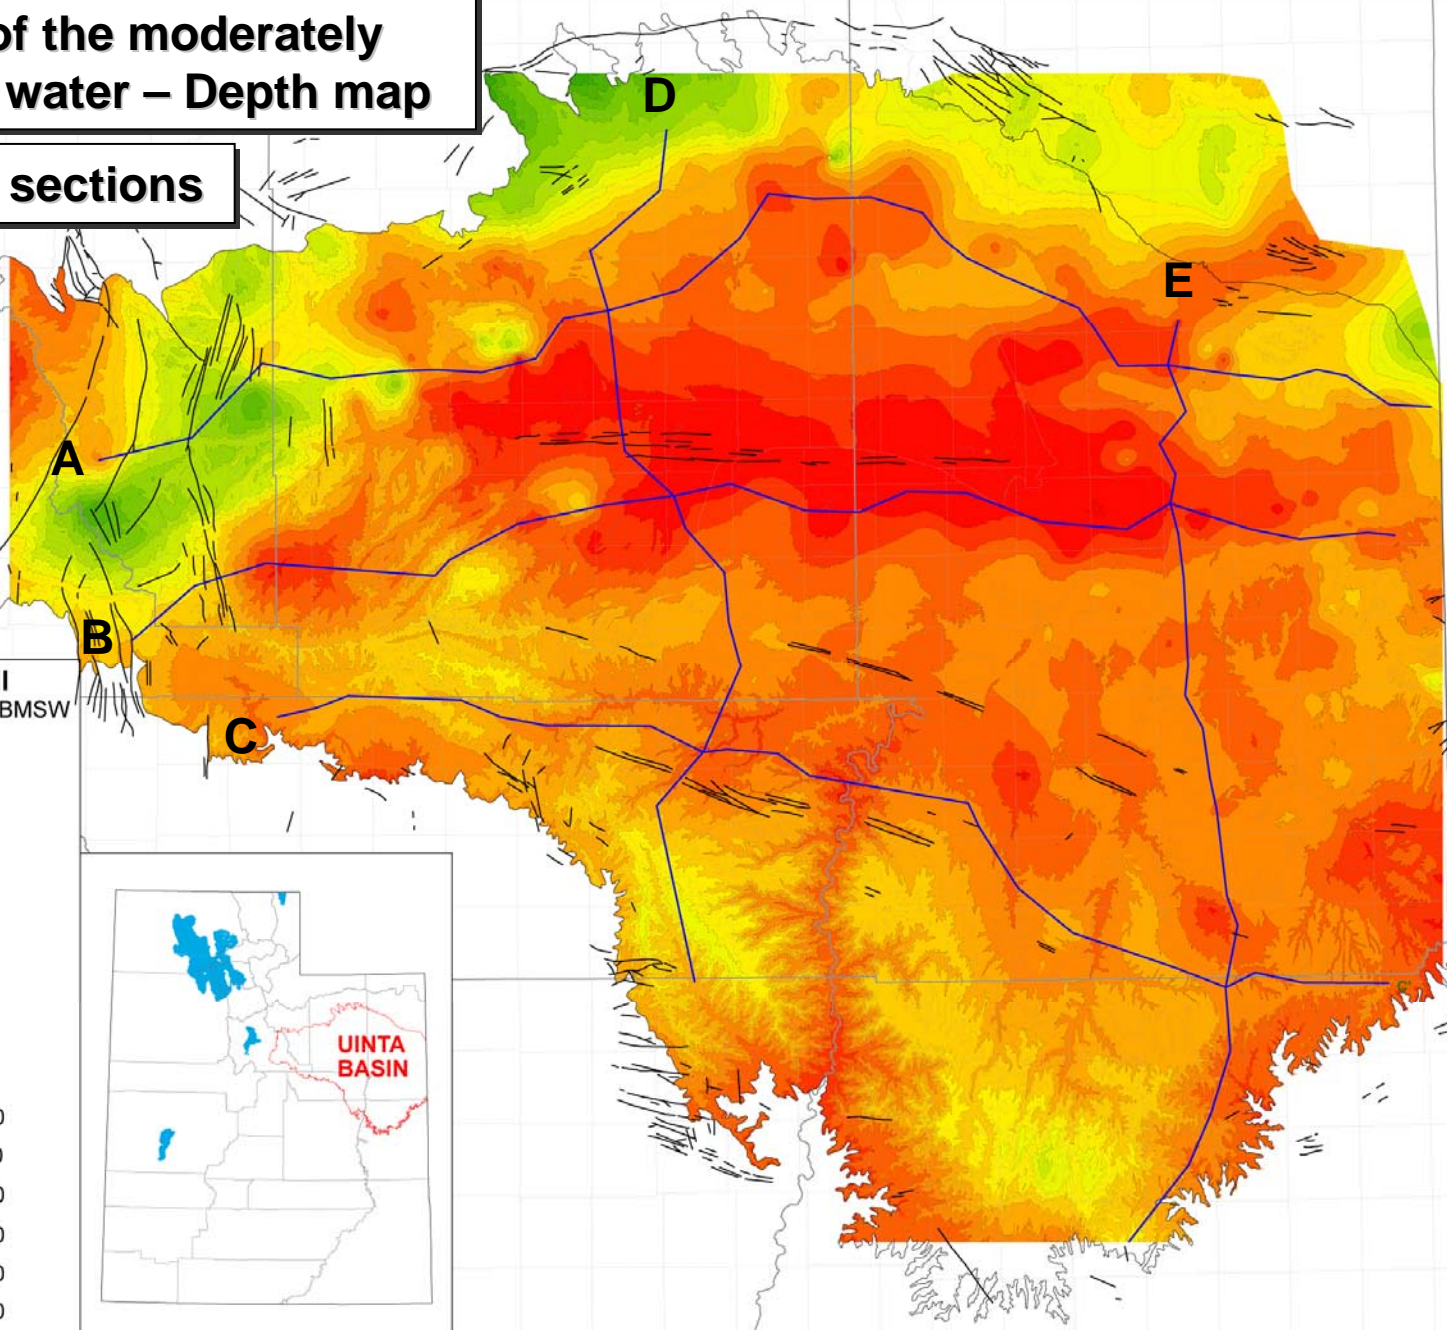

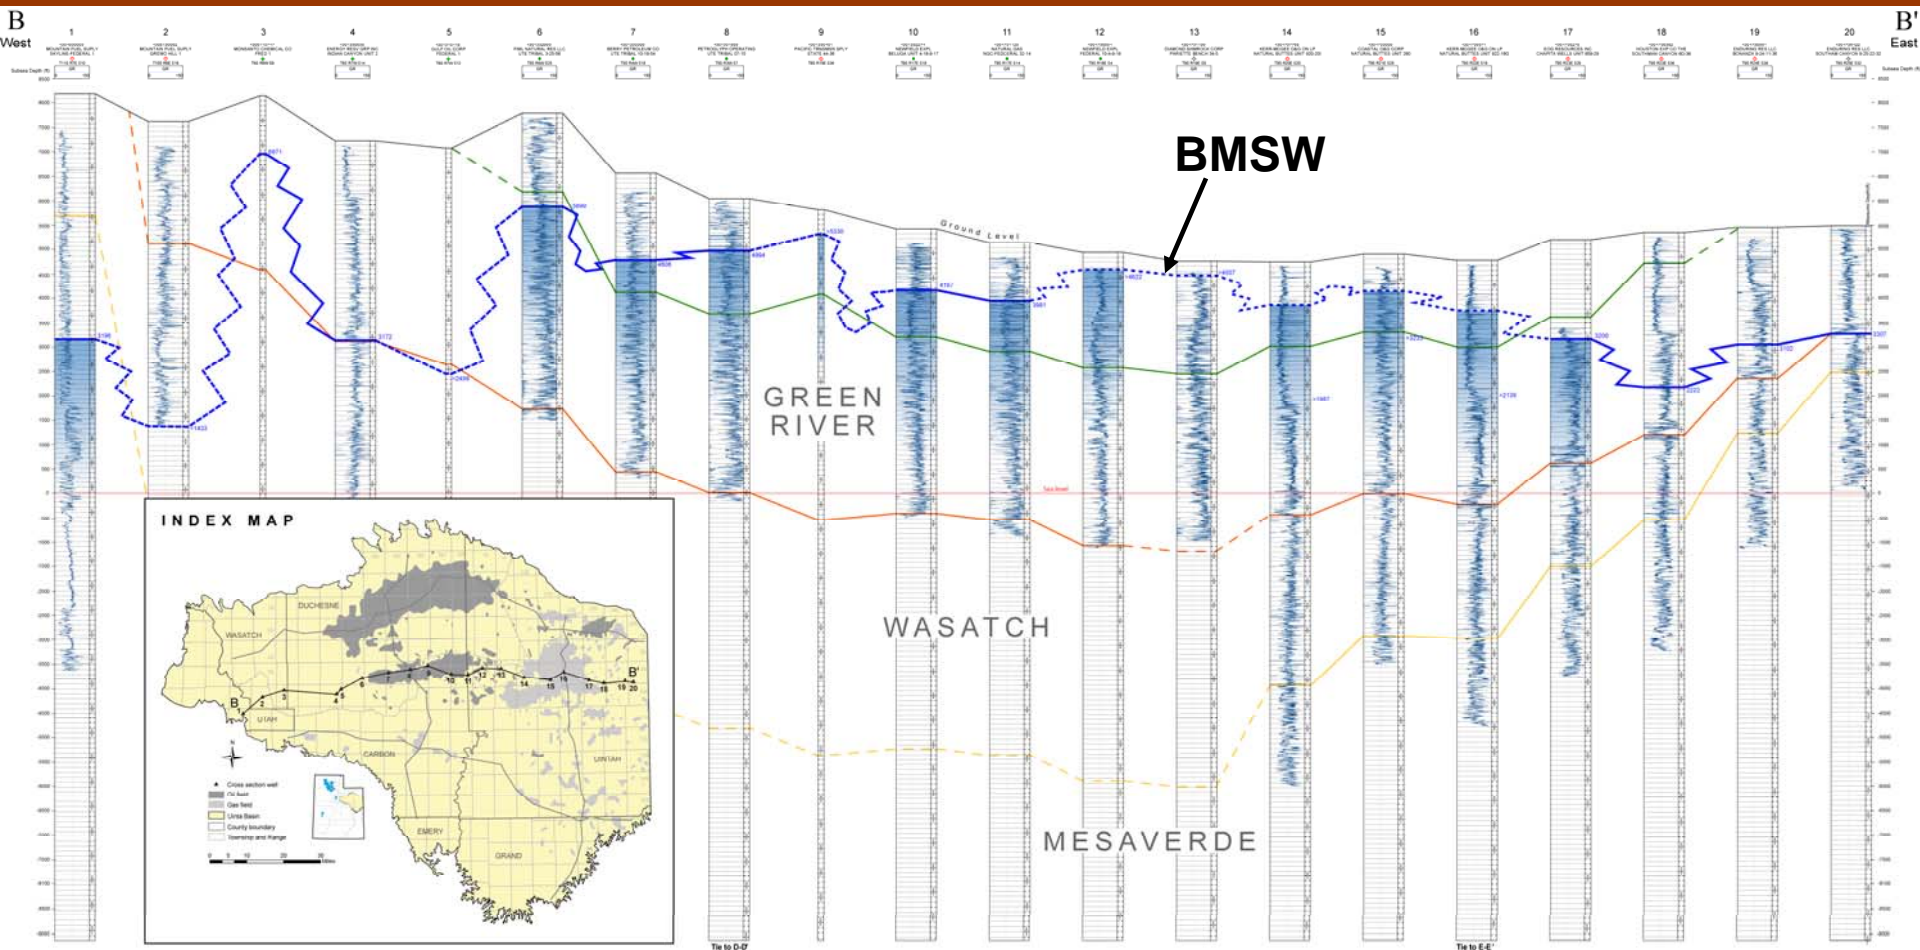

Base of the moderately  
saline water – Depth map

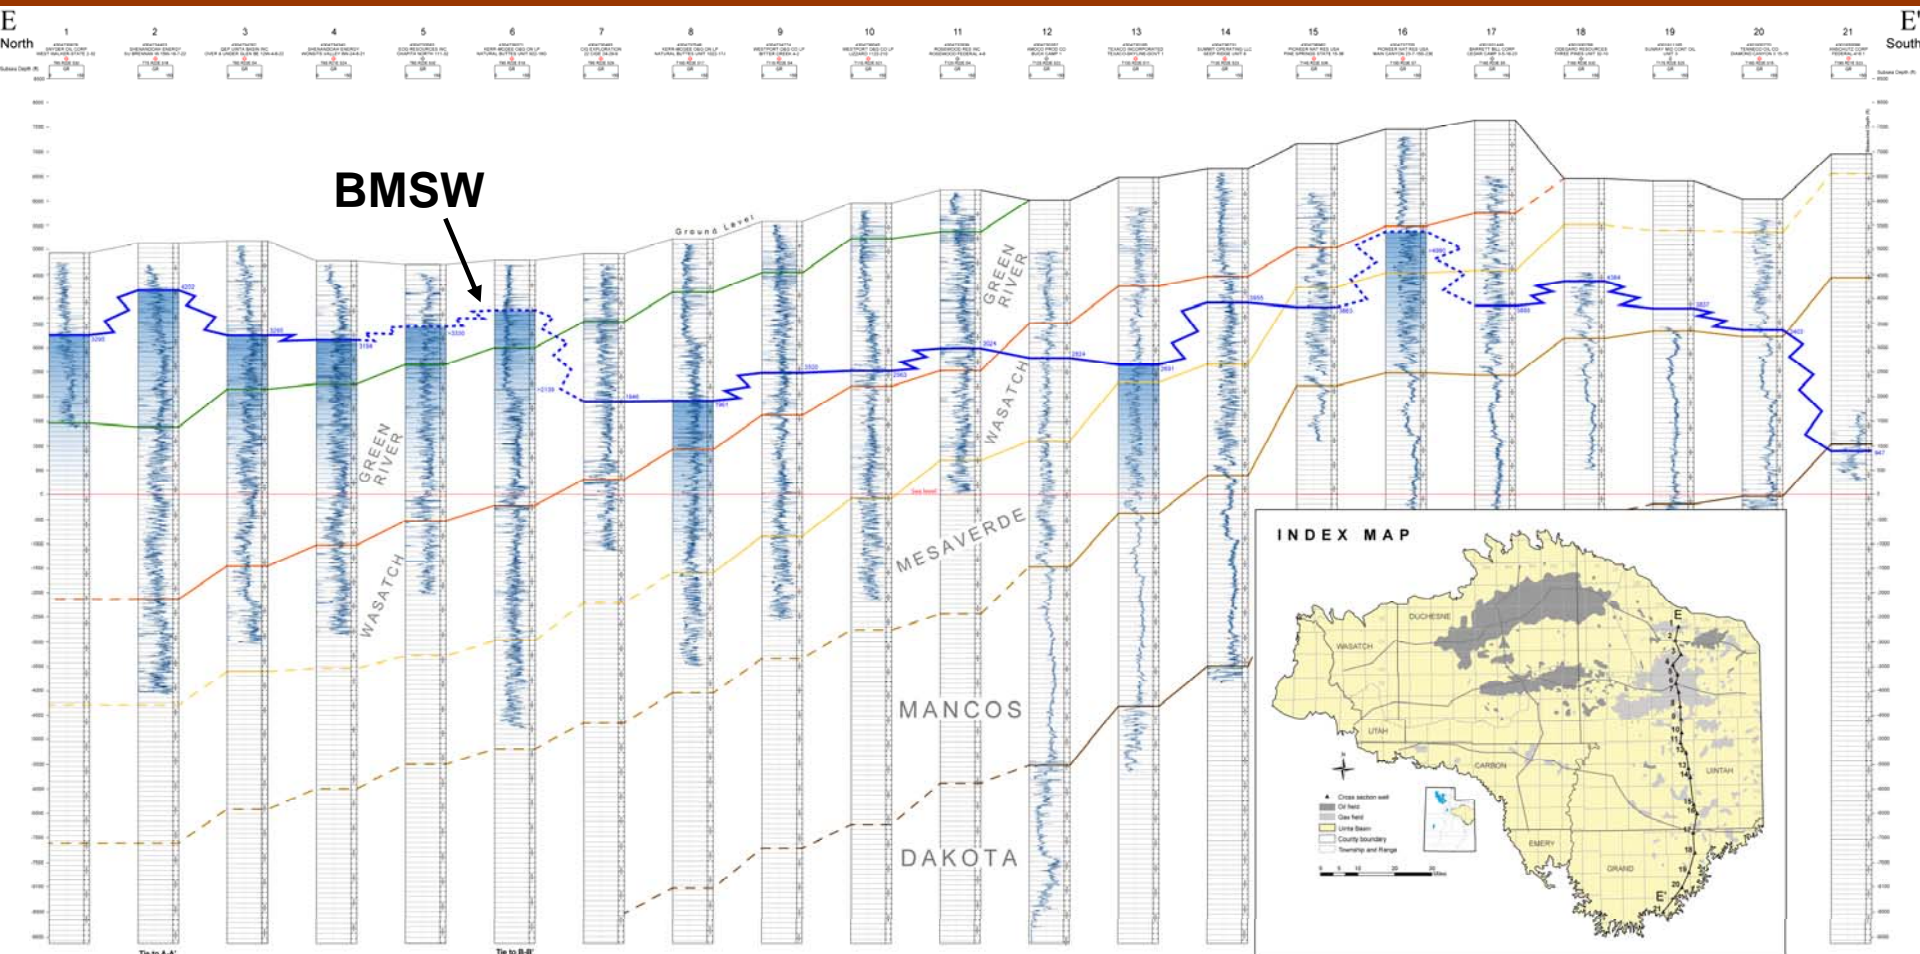

Cross sections

Contour fill  
Depth in ft to BMSW

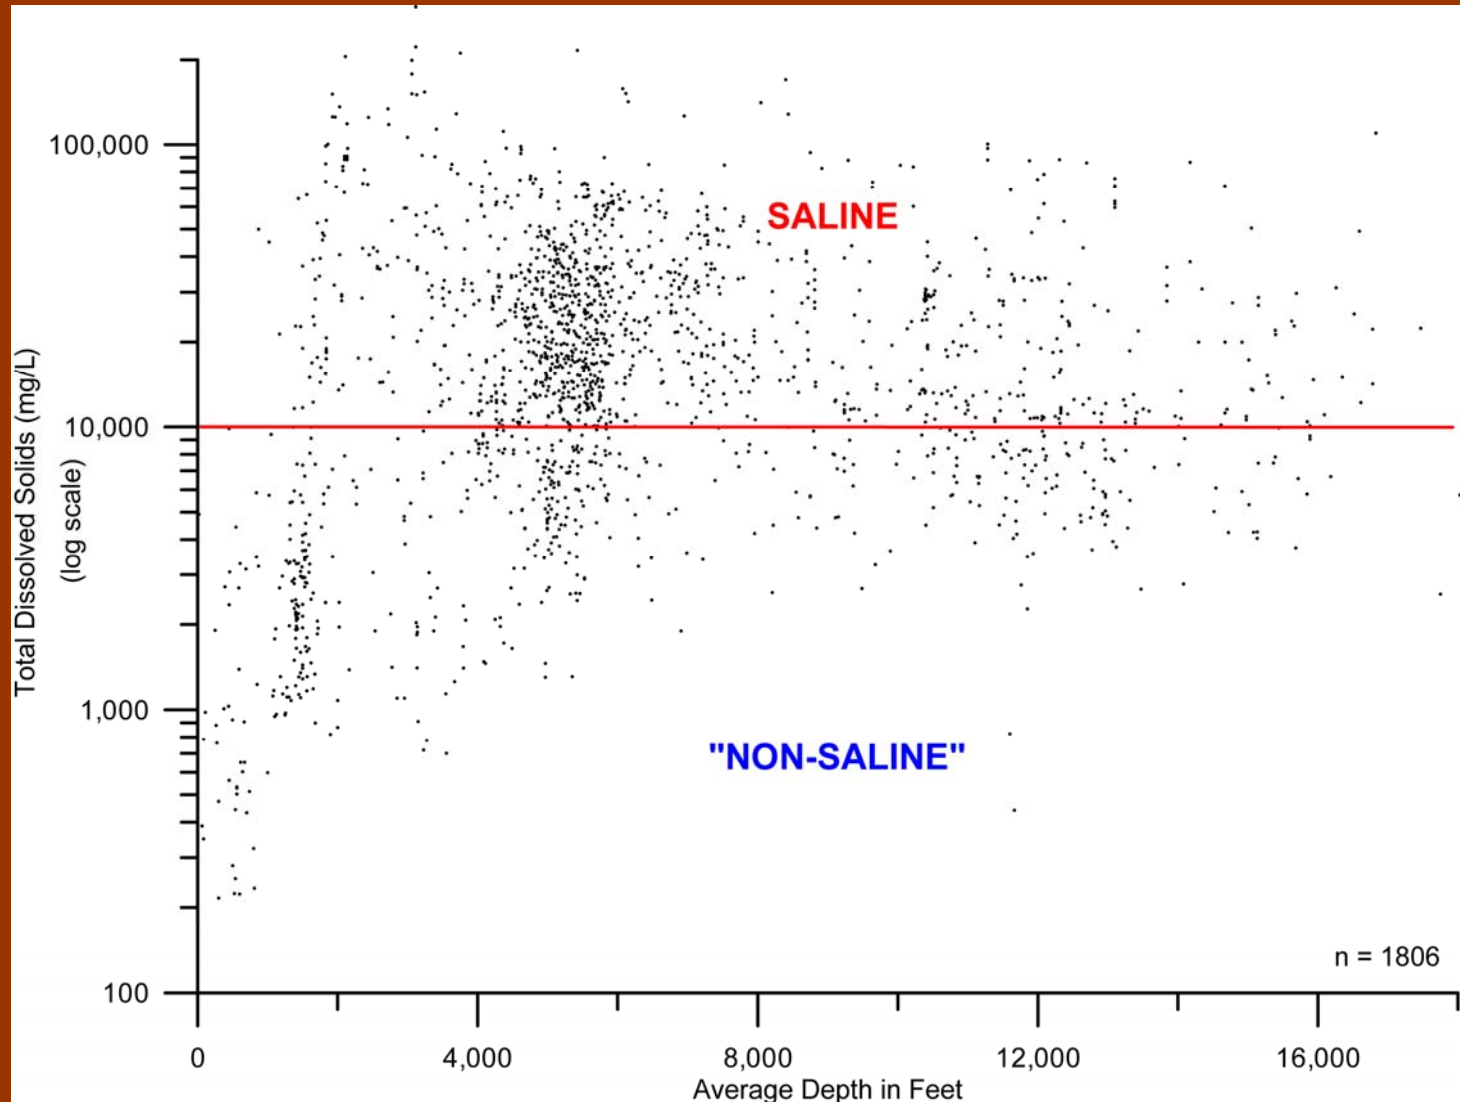

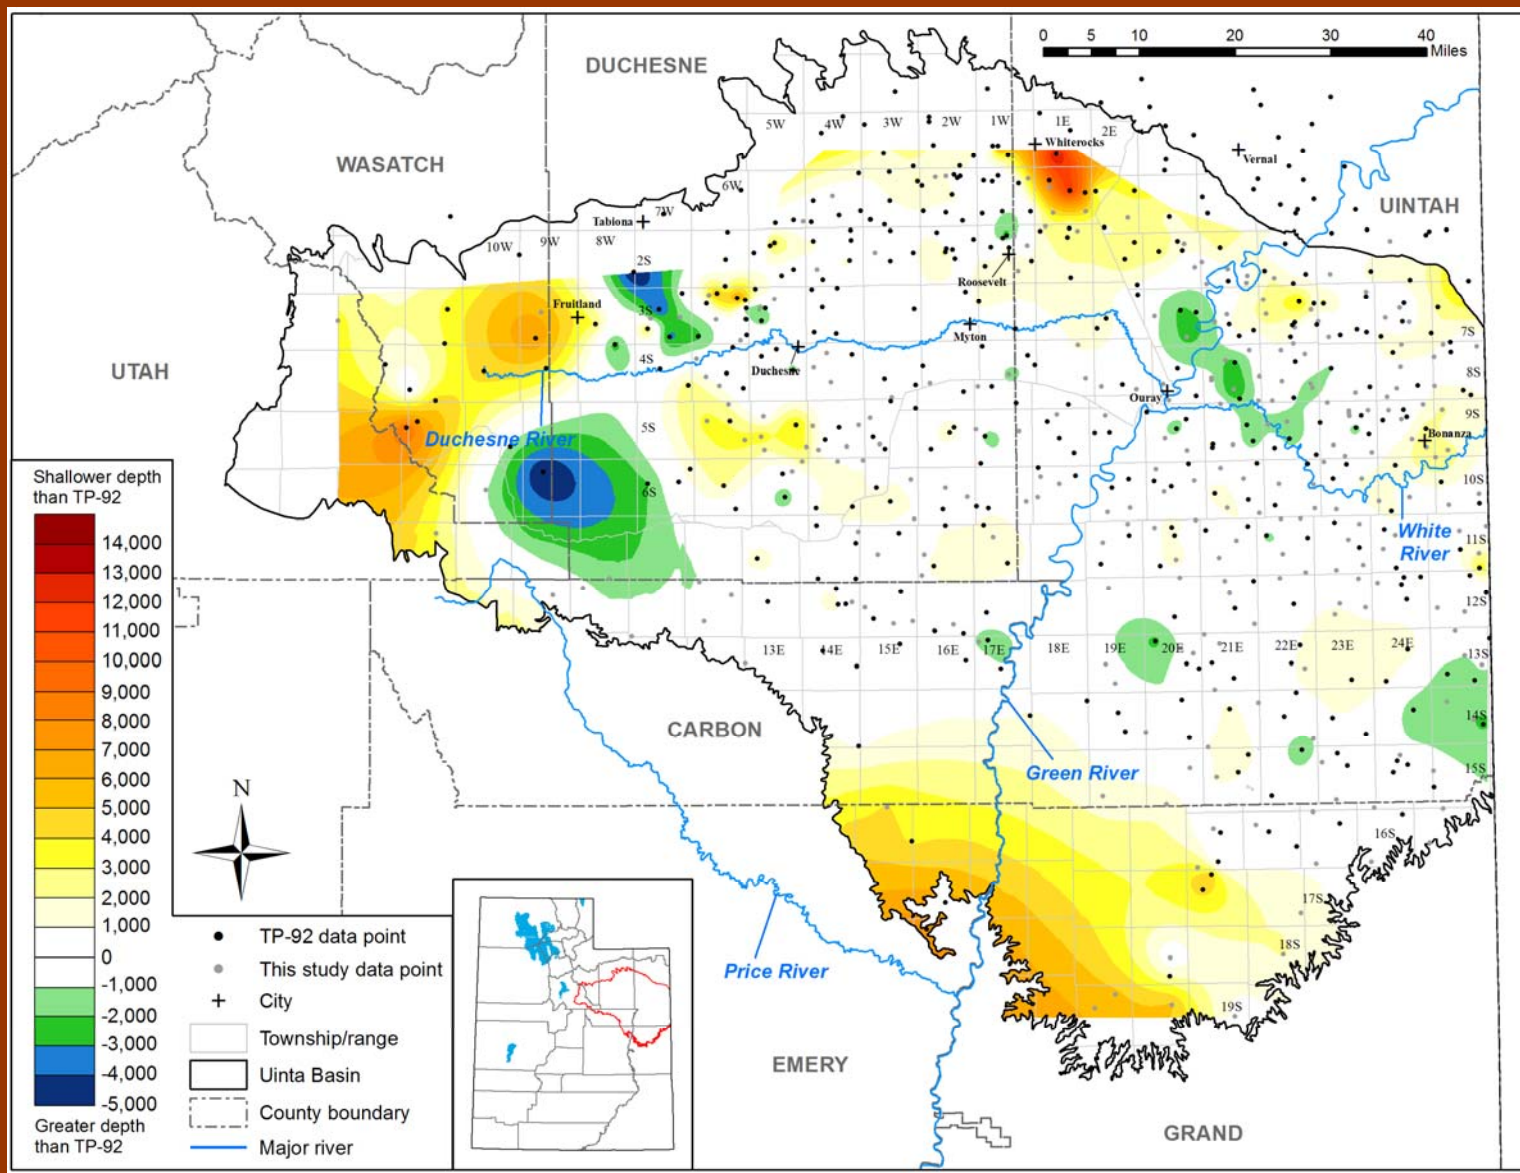

**Salinity does not correlate with depth (except in some specific formations)**

### Conclusions:

- BMSW is a transition zone, not a single boundary
- The BMSW is influenced by:
  - Recharging fresh groundwater (especially in the north)
  - Saline stratigraphy (Birds Nest aquifer, bedded salines in the northwestern Green River Formation)
  - Faults / groundwater flow paths
- Salinity is poorly correlated with depth (except in some specific formations)
- Differences between old and new maps are attributed to abundant new data and a revision of mapping rules
  - Changes in subsurface water chemistry due to abundant saline water disposal over the past 25 years can be demonstrated, but only in a few specific wells and fields
  - The volume of disposed water is very minor compared to the storage space available within the basin, and therefore is not expected to affect large areas
- This new map should be used for planning purposes, as a first-pass guide to finding appropriate depths for saline water disposal, but should always be accompanied by water chemistry analyses from the proposed disposal intervals

# Task 3:

## Geologic characterization of the Birds Nest aquifer

## Problem:

The Birds Nest aquifer has been identified by Uintah County natural gas producers as a zone suitable for large-scale saline water disposal; however, this aquifer is poorly understood and needs further study to determine potential impacts of proposed/active disposal

- Unresolved questions at the beginning of the study:
  - Geologic character of the aquifer
  - Areal extent
  - Thickness
  - Water chemistry
  - Potential disposal related impacts to oil shale deposits
  - Impact of cross-cutting gilsonite veins

## **Solution:**

Detailed geologic characterization using well data, cores, outcrops, and available water chemistry

## **Research / Deliverables:**

- Annotated bibliography
  - 38 references (very limited data)
- Well information database – aquifer tops, formation tops, etc.
  - 322 oil/gas and oil shale wells evaluated
- Water chemistry database
  - 208 analyses from 161 different wells (majority of data from Anadarko)
- 21 detailed core descriptions – including photos
- 4 measured sections and numerous field observations in other locations
- 5 detailed regional cross sections
- Maps – outcrop, areal extent, thickness, water quality, overburden, interburden

# Not your typical aquifer!

**The Birds Nest aquifer formed from the dissolution of saline minerals (mostly nahcolite) within the upper Green River Formation oil shale zone**

### Not your typical aquifer!

# Geologic Characterization of the Birds Nest aquifer

## Birds Nest aquifer water chemistry – Volume calculations

## Birds Nest aquifer water chemistry – Volume calculations

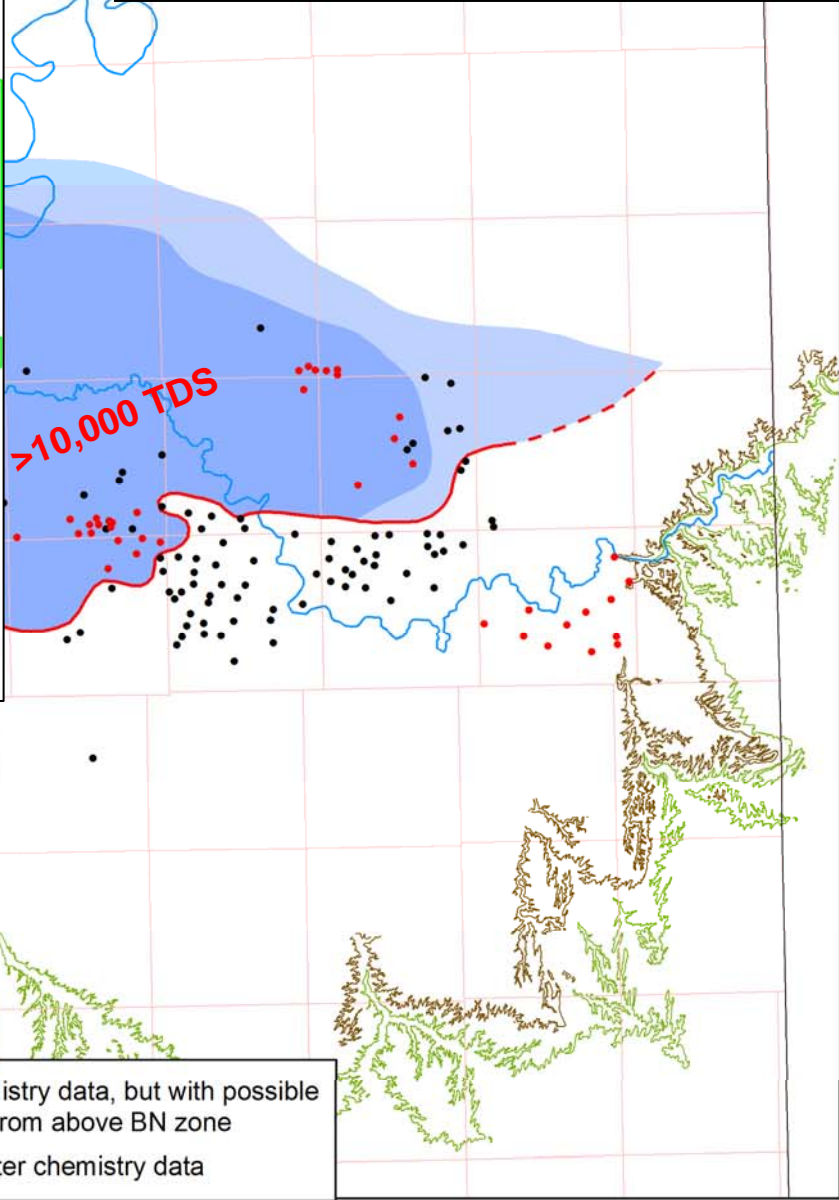

Overall macro porosity = 2.5%

Geologic Characterization of the Birds Nest aquifer

Birds Nest aquifer water chemistry – Volume calculations

- Mahogany zone outcrop
- Saline zone outcrop
- Major river
- Well with BN water chemistry data, but with possible dilution of fresher water from above BN zone
- Well with BN specific water chemistry data

Approximate space for saline water:

Upper BN zone

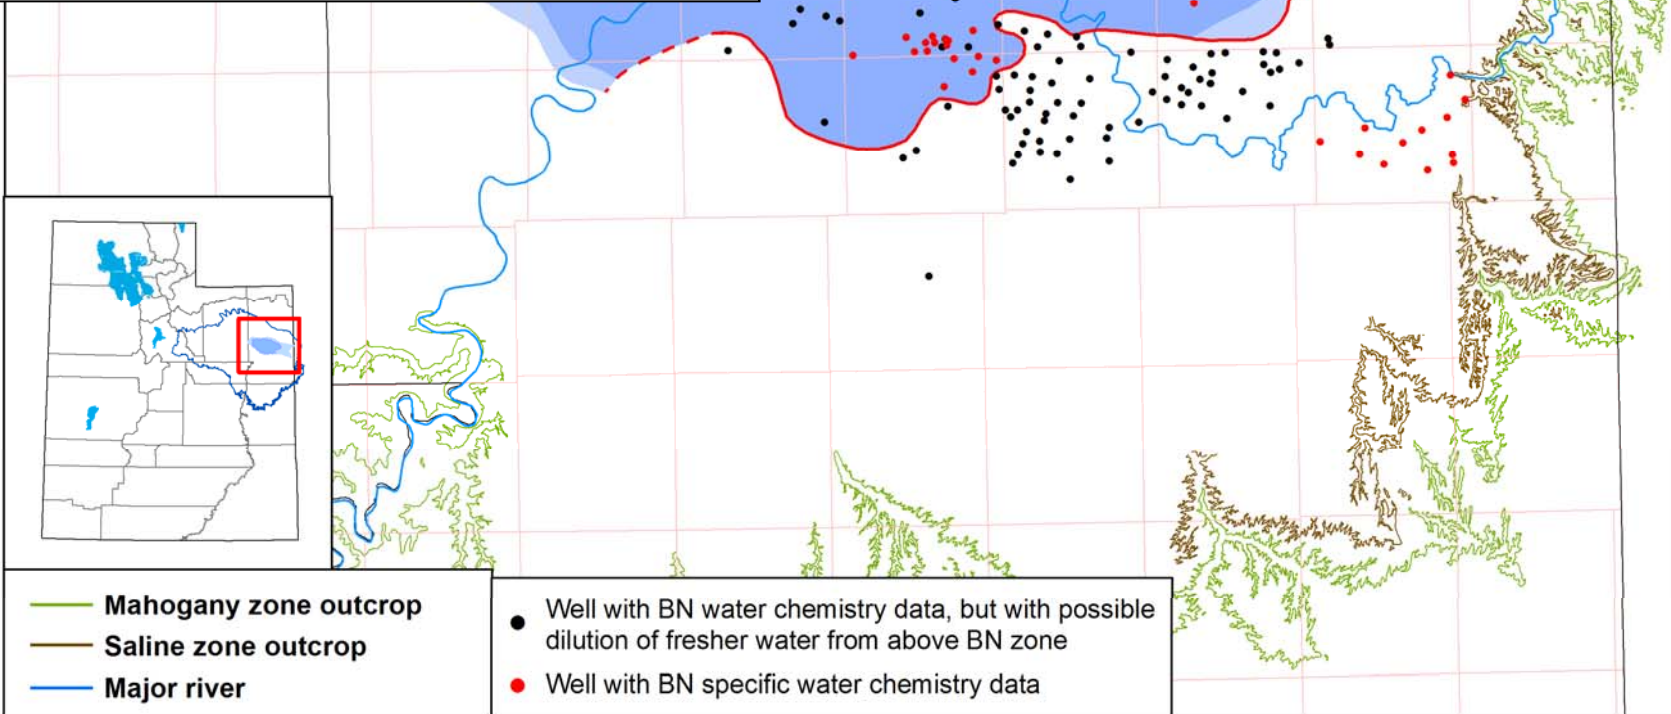

Area = 359.0 miles<sup>2</sup>  
Mean thickness = 81.7 ft  
Total volume =  $8.2 \times 10^{11}$  ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 20,436,482,303 ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 469,157 acre feet

Lower BN zone

Area = 498.6 miles<sup>2</sup>  
Mean thickness = 85.2 ft  
Total volume =  $1.2 \times 10^{12}$  ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 29,616,785,540 ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 679,908 acre feet

3: Geologic Characterization of the Birds Nest aquifer

Birds Nest aquifer water chemistry – Volume calculations

Approximate space for saline water:

Upper BN zone

Area = 359.0 miles<sup>2</sup>  
Mean thickness = 81.7 ft  
Total volume =  $8.2 \times 10^{11}$  ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 20,436,482,303 ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 469,157 acre feet

Lower BN zone

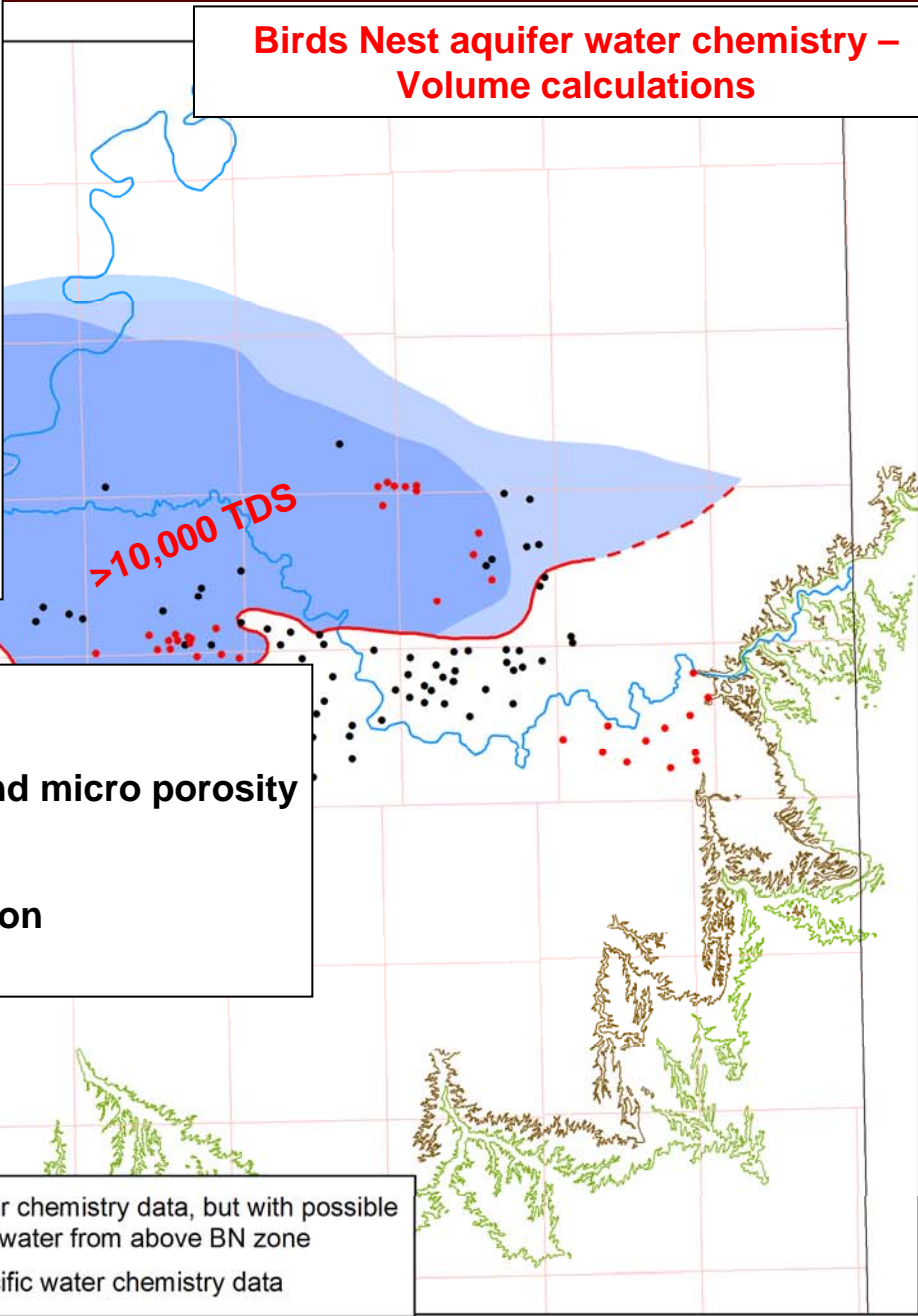

Area = 498.6 miles<sup>2</sup>  
Mean thickness = 85.2 ft  
Total volume =  $1.2 \times 10^{12}$  ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 29,616,785,540 ft<sup>3</sup>  
Macro pore volume (at 2.5%) = 679,908 acre feet

Complications:

- Does not take into account fracture porosity and micro porosity
  - Highly variable and hard to quantify
- Large areas display no saline mineral dissolution
  - These areas are very difficult to quantify

3: Geologic Characterization of the Birds Nest aquifer

Birds Nest aquifer water chemistry – Volume calculations

- Mahogany zone outcrop
- Saline zone outcrop
- Major river
- Well with BN water chemistry data, but with possible dilution of fresher water from above BN zone
- Well with BN specific water chemistry data

## Gilsonite veins – Conduits or barriers?

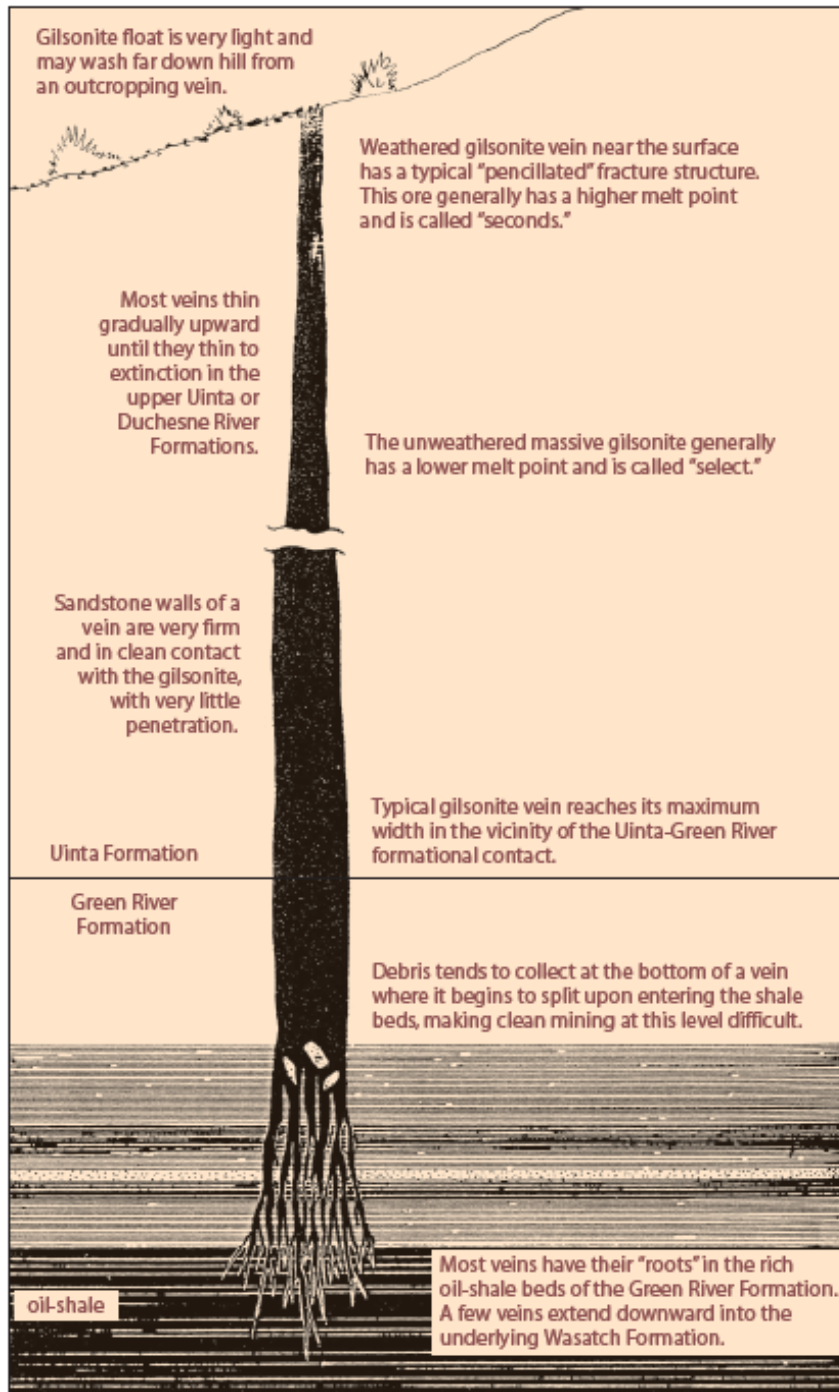

Figure 6. Cross section of a typical gilsonite vein (from Eldridge, 1901).

**Gilsonite veins – Conduits or barriers?**

**Gilsonite veins – Conduits or barriers?**

**Gilsonite veins – Conduits or barriers?**

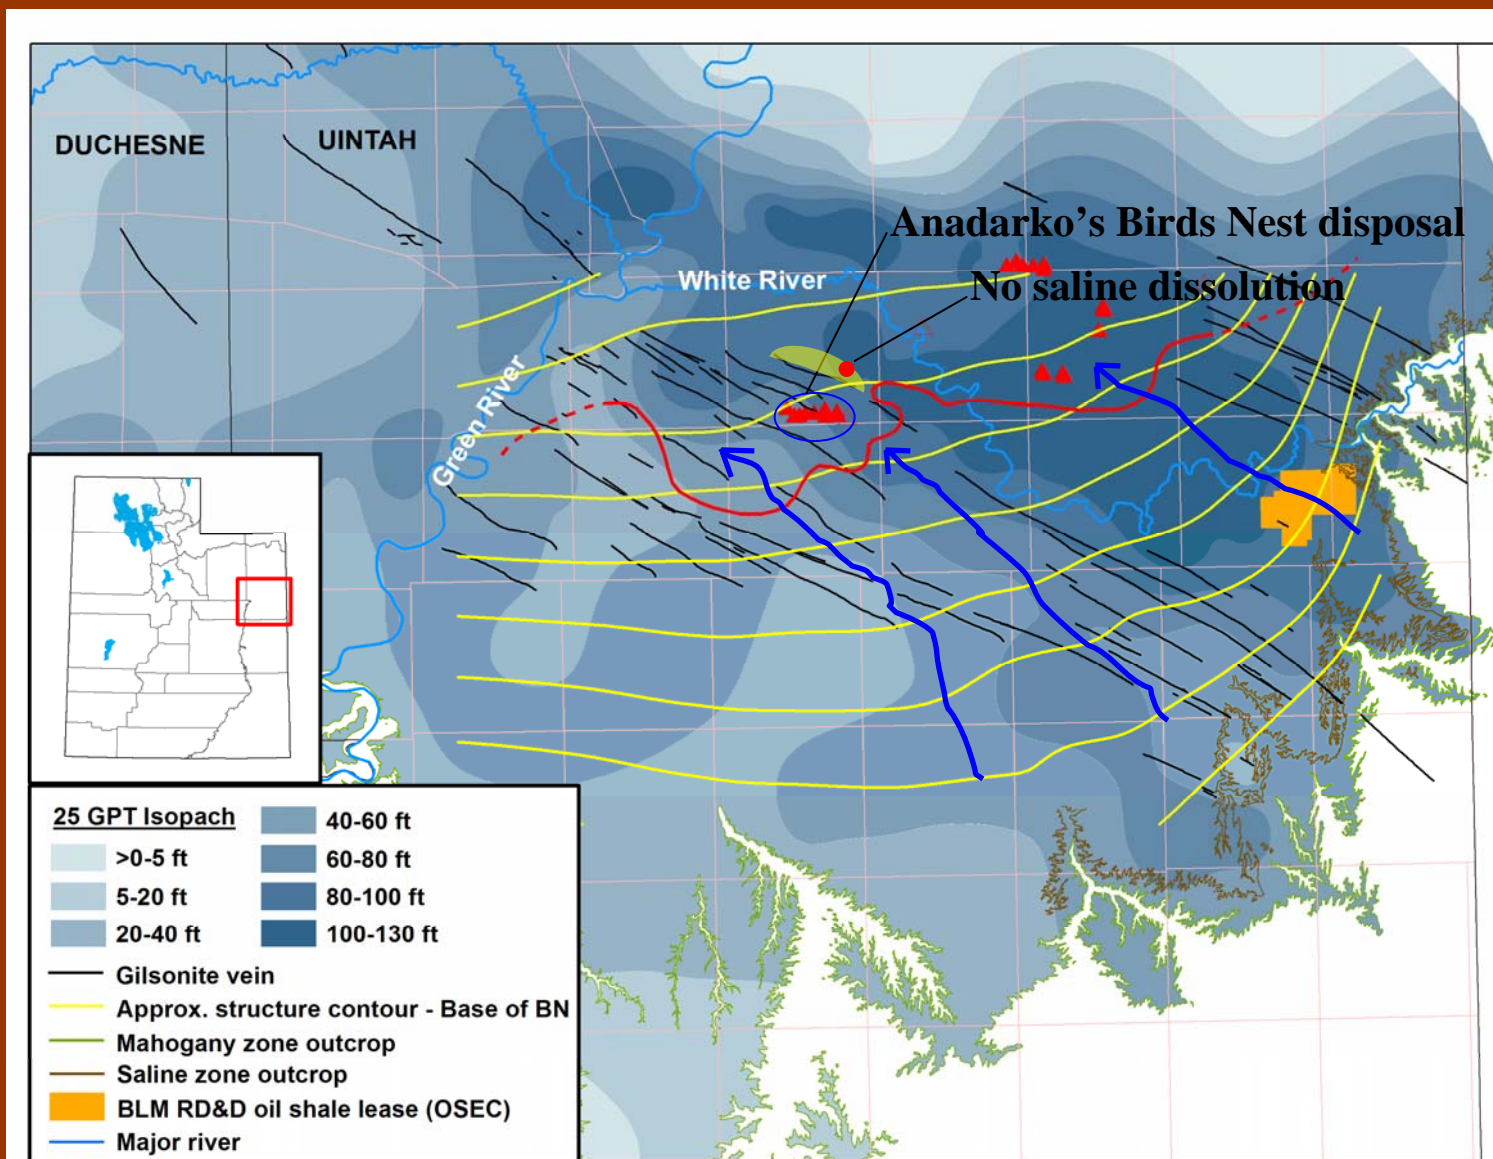

## Gilsonite veins and associated fracture zones

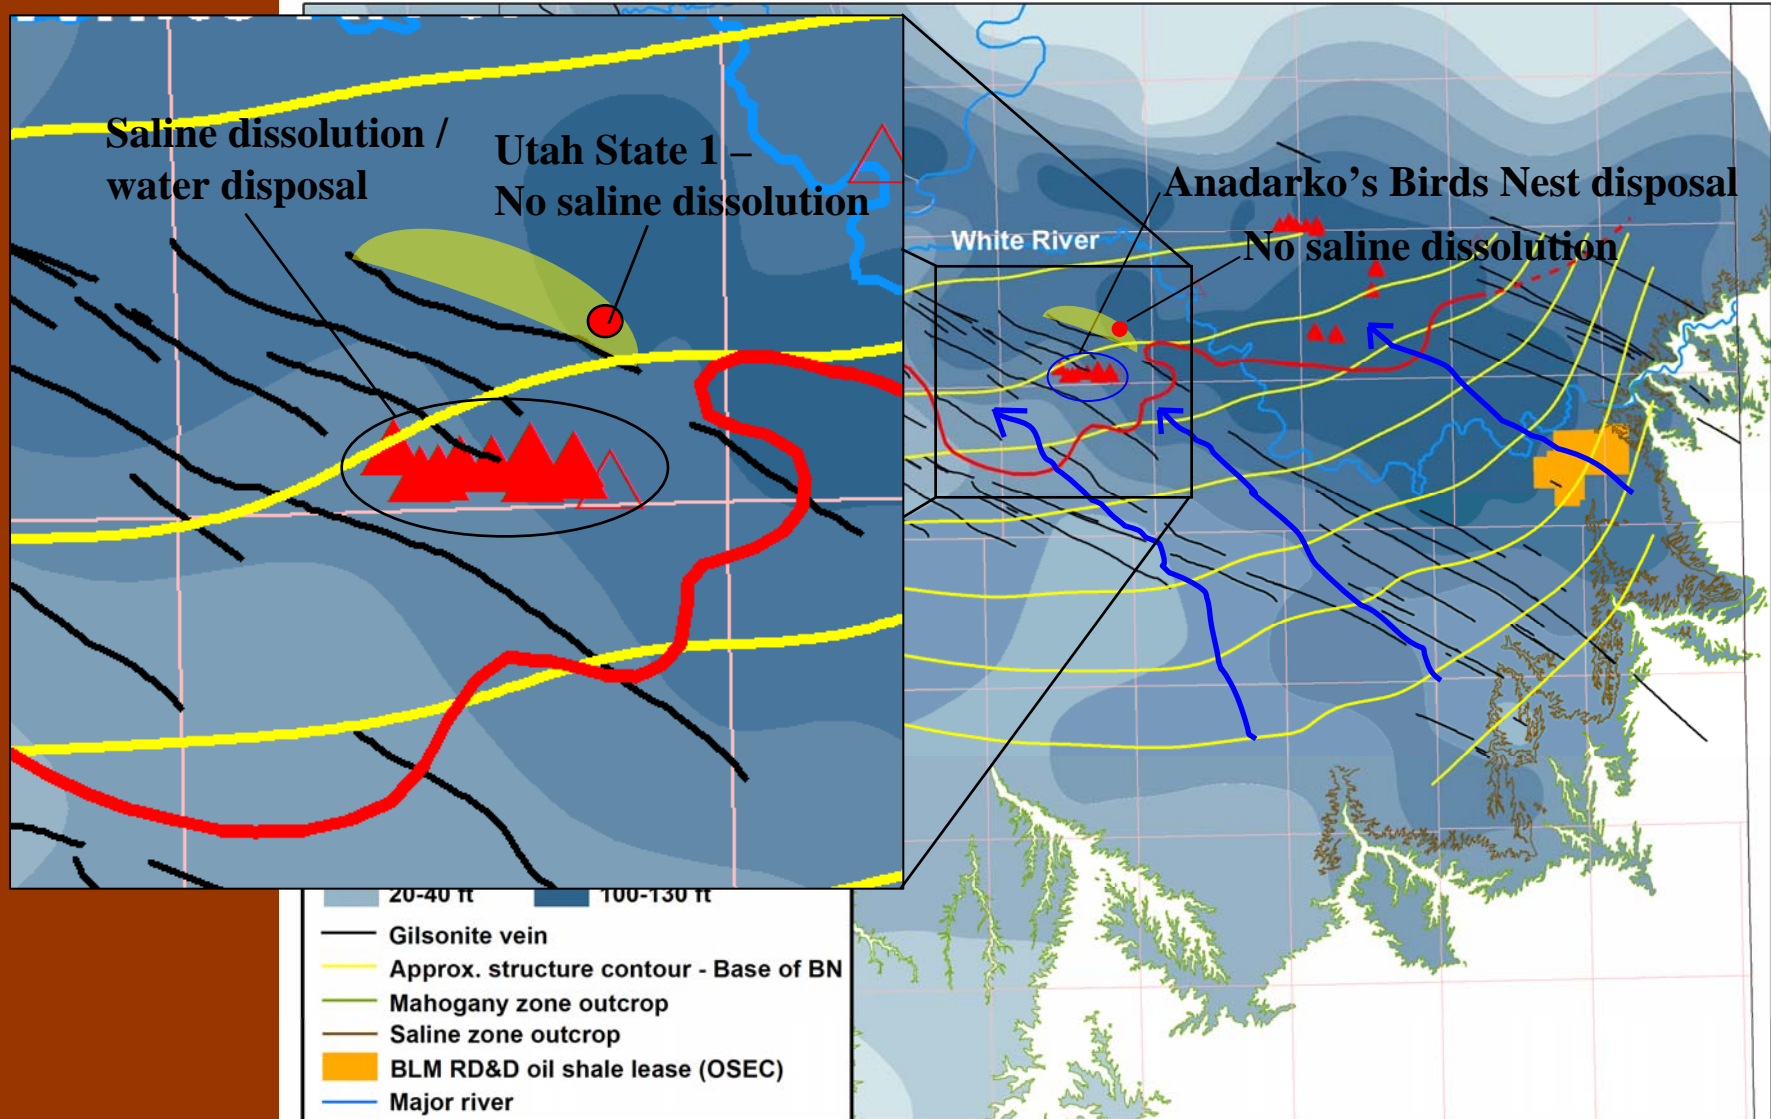

# Gilsonite veins – Evidence for groundwater barrier

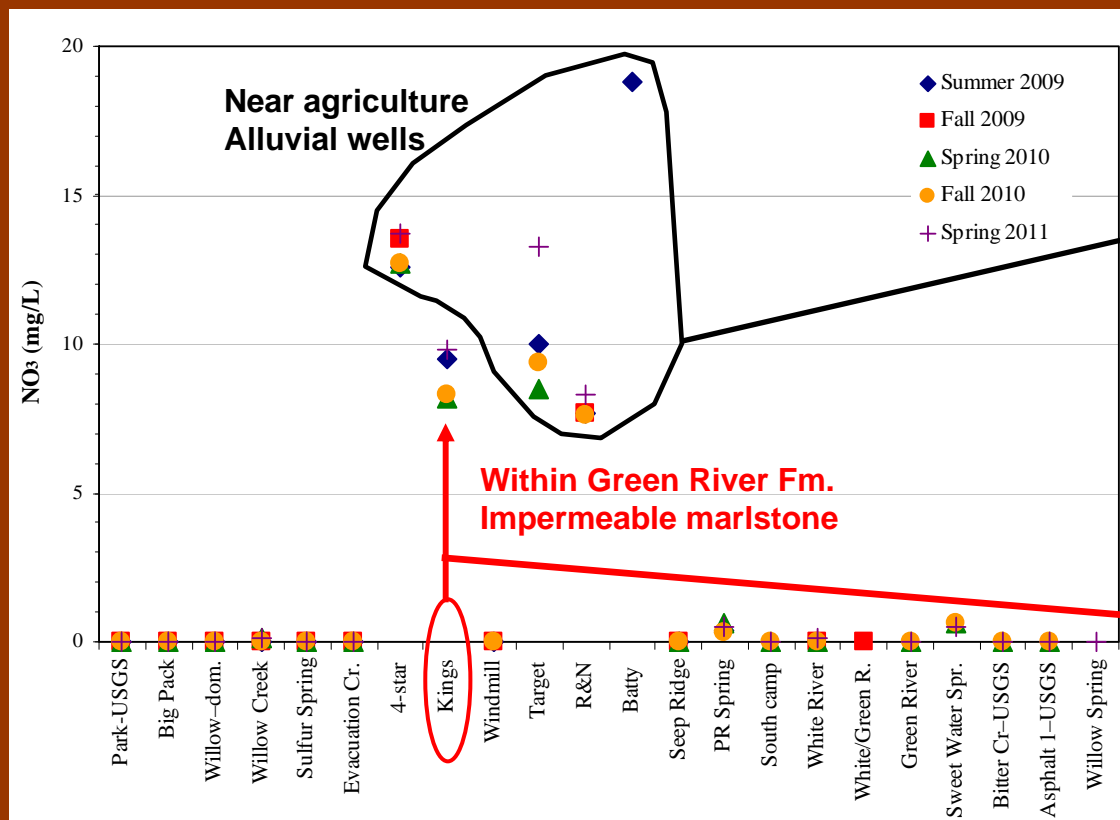

### Gilsonite veins – Evidence for groundwater barrier

### Gilsonite veins – Evidence for groundwater conduit

- Kings well is used for watering stock
- Wastewater from the cows/sheep could be using the gilsonite vein to travel into the groundwater aquifer

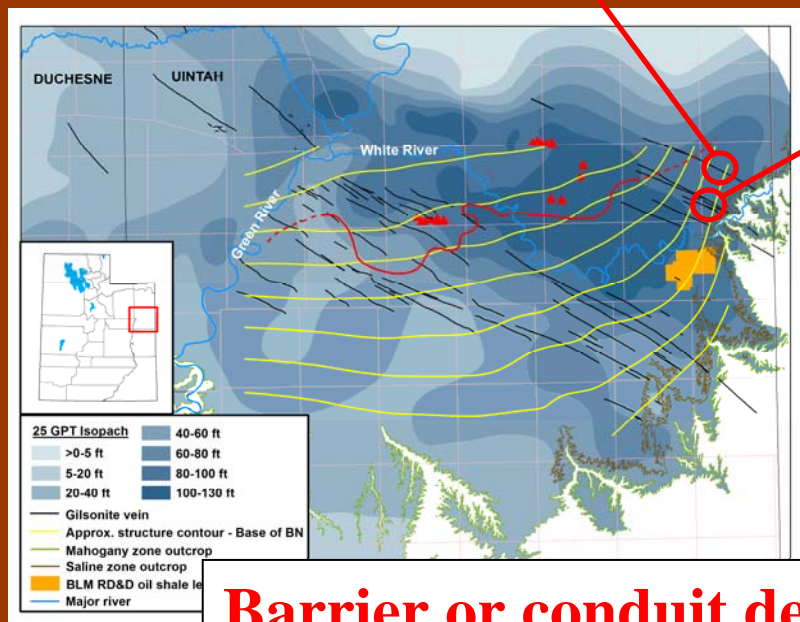

## Bonanza Vein

- Highly fractured gilsonite
- 630 ft depth (Uinta Fm)
- Lots of water infiltration (from wall rock and vein)

## Independent Vein

- "Solid" gilsonite
- 230 ft depth (Uinta Fm)
- Minor water infiltration (from wall rock)

**Barrier or conduit depends on type and thickness of vein**

## Conclusions:

- The Birds Nest aquifer has significant potential as a saline water disposal zone...
  - Currently contains highly saline water in northern areas
  - Large amount of storage space (on a vacuum) due to the dissolution of saline minerals
  - Shallow (good or bad?)
  - Located close to significant drilling activity
  - Should only affect leaner oil shale deposits with marginal economic potential
- But poses unique challenges and risks:
  - Large areas with no dissolution, reduces potential
  - Cross-cutting gilsonite veins (and associated fractures) could transmit water vertically through the section, posing risks to “fresh” water aquifers and oil shale operations
  - Monitoring wells will be key, but add expense

# Task 4:

## Baseline water chemistry database for lands with oil shale development potential

### Problem:

There is a regulatory need for baseline water quality data from lands identified by the BLM as having oil shale development potential

- Pre-oil shale development, surface and shallow bedrock aquifer water quality
- Groundwater from greater depths in the oil and gas producing zones is more well known and was not the focus of this study

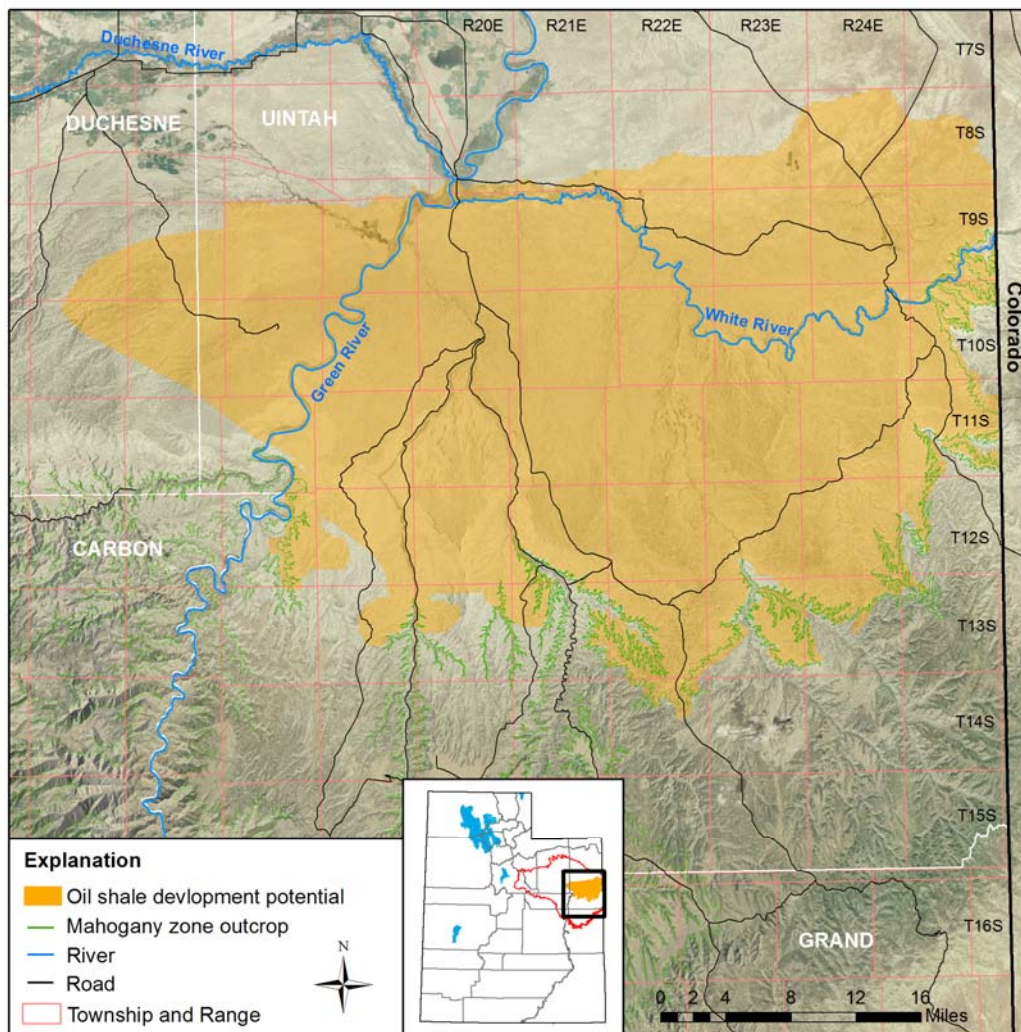

### Research / Deliverables:

- Sample water from wells and surface sites bi-annually (5 rounds)
- Database of water quality analyses including:
  - general chemistry
  - nutrients
  - dissolved oxygen
  - dissolved metals
  - volatile organic compounds
  - total organic carbon

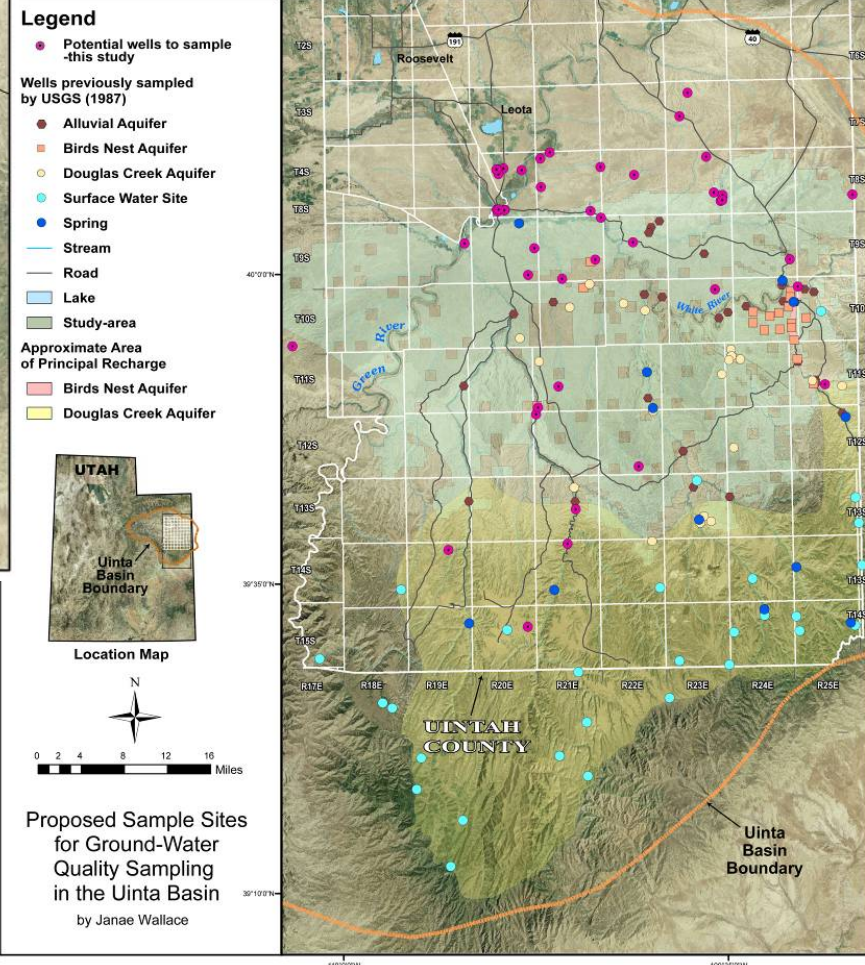

## Task 4: Baseline water chemistry database

**Lands identified by the BLM as having oil shale development potential (2008/2012 PEIS)**

**Original sampling plan (Oct. 2008)**  
**~50 sampling sites**

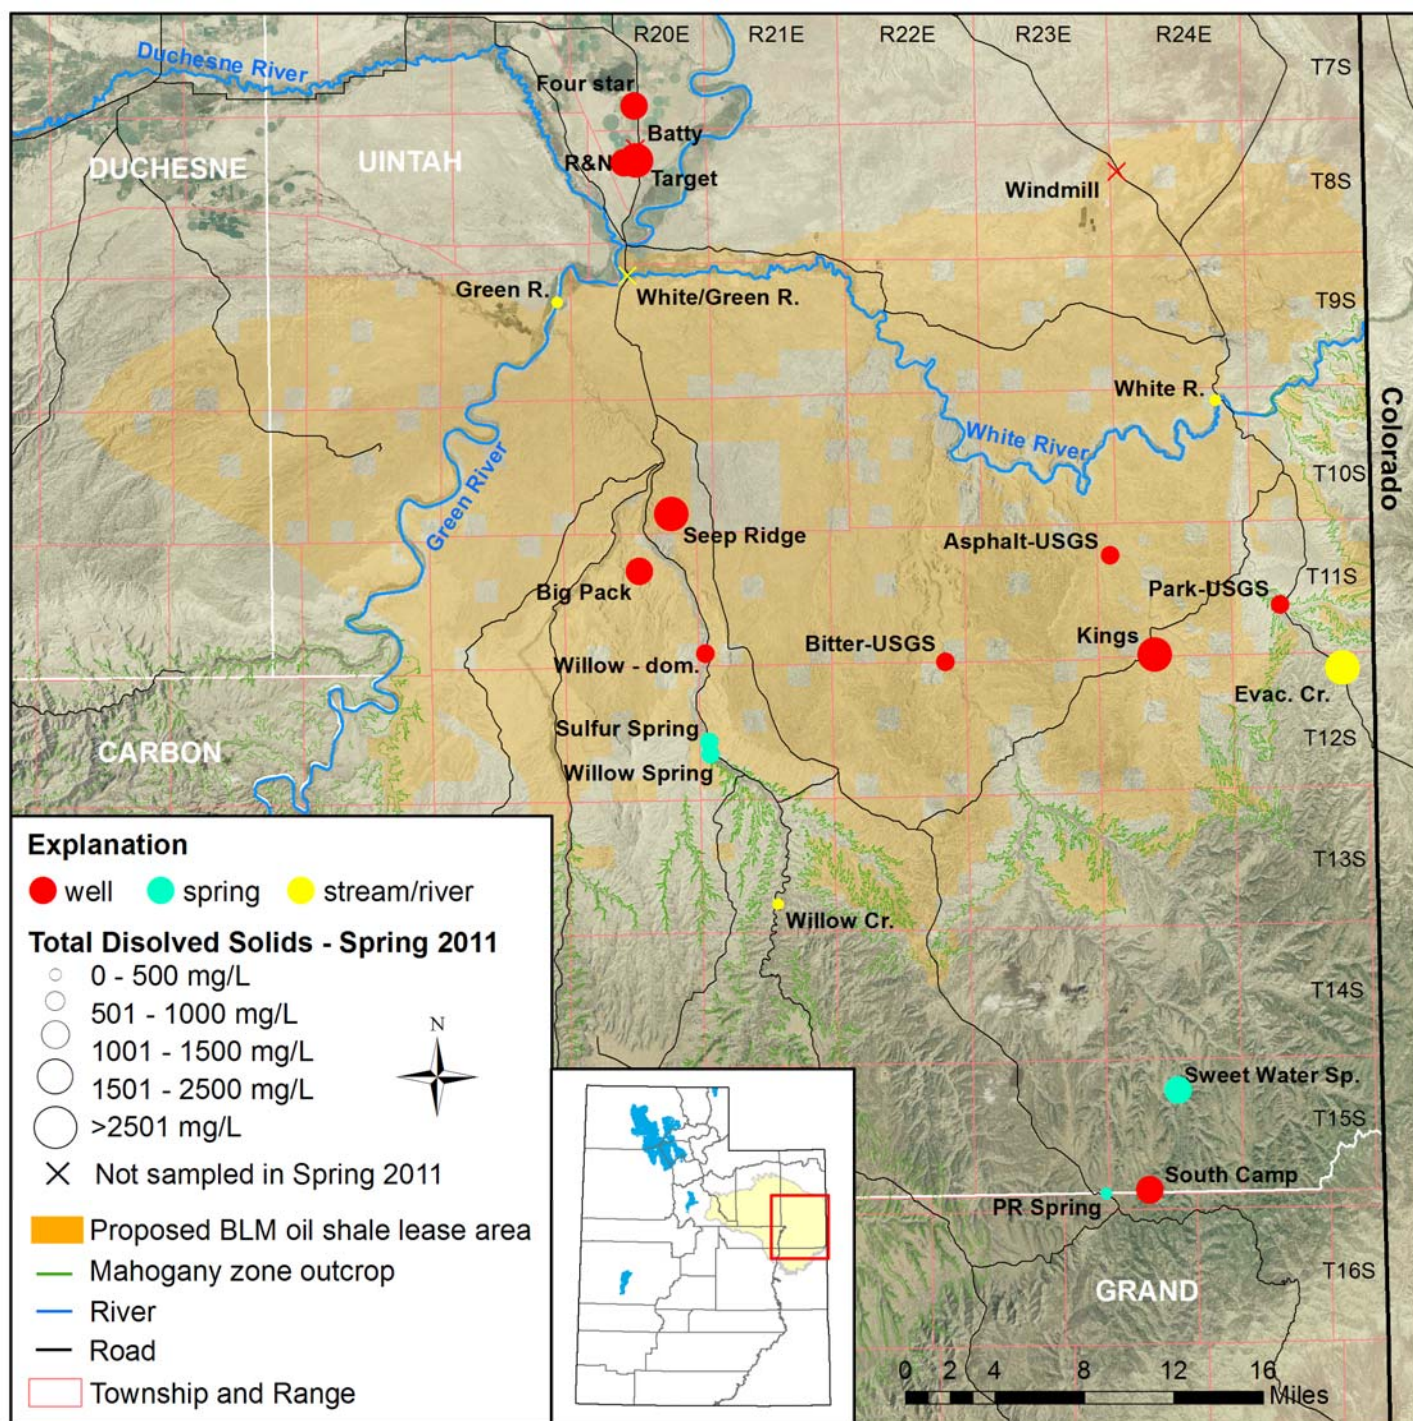

Only 24 sites were  
suitable for sampling

# TDS for sites sampled spring 2011

### Bi-annual TDS water chemistry for all sites – minimal variation

### Bi-annual TDS water chemistry for all sites – minimal variation

### Explanation

● well ● spring ● stream

### Total Dissolved Solids

- 0 - 5.0 mg/L
- 5.1 - 10.0 mg/L
- 10.1 - 20.0 mg/L

~ River

~ Roads

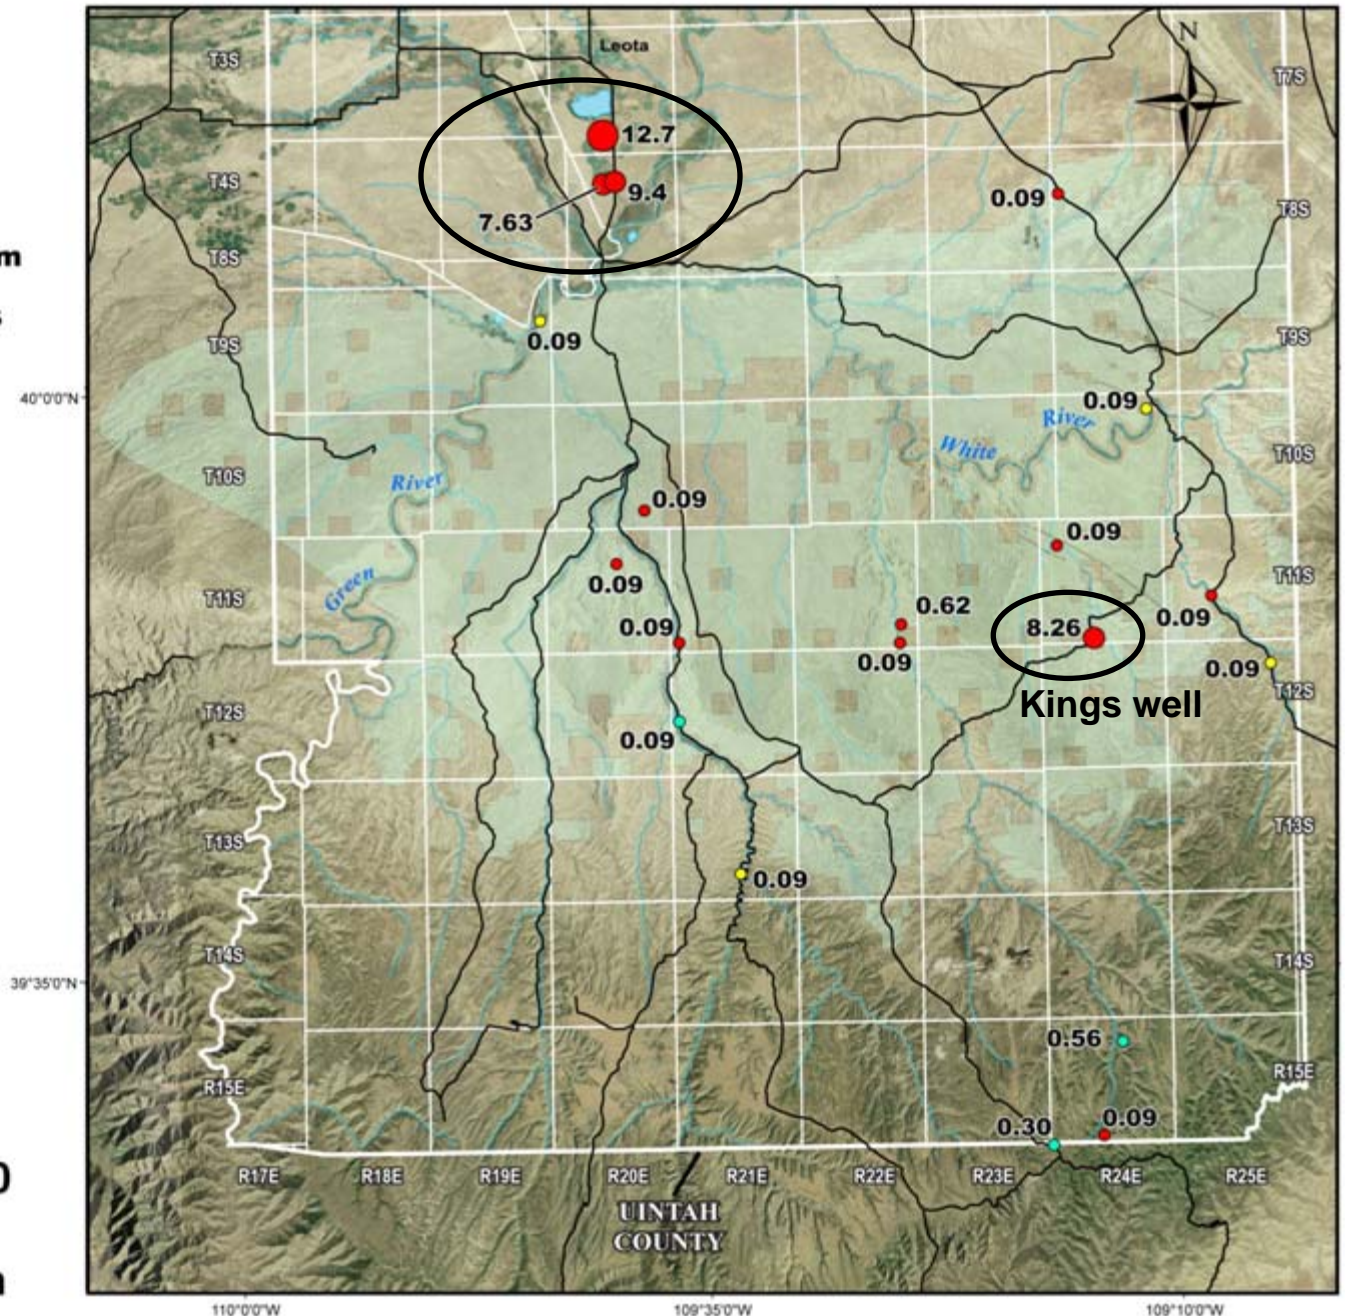

Water Body

BLM UT  
(oil shale lease area)

Location Map

UGS Autumn 2010  
Nitrate  
in the Uinta Basin

### Bi-annual nitrate water chemistry for all sites – minimal variation

### Bi-annual nitrate water chemistry for all sites – minimal variation

### Conclusions:

- New baseline water chemistry database provides GIS-based information to help local planners and potential oil shale/oil sand developers preserve the quality of ground and surface water through careful land-use planning
- Minimal seasonal changes in water chemistry
- Highest TDS was 2832 mg/L from Evacuation Creek (flows along outcrop of Birds Nest aquifer)
- Most nitrate concentrations were below detection limits, except in agricultural areas to the north and Kings well
- Some samples had detectable VOCs, but all were below EPA maximum contaminant levels
- Most of the water, in terms of being potable, could be used as a source for drinking water if treated properly, with all having TDS concentrations below 3000 mg/L, the upper limit set by the Utah Water Quality Board as “drinking water quality”

## **Task 5:**

# **Analysis of produced water from simulated in-situ oil shale extraction technologies**

This research was performed by Dr. Milind Deo and Pankaj Tiwari (PhD student),  
Department of Chemical Engineering, University of Utah

UGS role – provide oil shale samples (core plugs) for  
all experiments

## **Research:**

Simulate in-situ oil shale extraction in the laboratory to:

- 1) Determine the presence and species of dissolved organics in the water phase post-pyrolysis
- 2) Determine the affect the presence of water has on retorting and its products

Several experiments were performed:

- 1) Water-soaked pyrolysis on powdered and whole-rock samples
- 2) Hydrous pyrolysis experiments at different temperatures
- 3) Analysis of water-phase products from non-hydrous pyrolysis experiments

Simplified results:

- 1) Very little water is released during retorting of Utah oil shale, thus reducing the potential for large volumes of water needing disposal during commercial-scale in-situ retorting
- 2) Water produced in the laboratory experiments contained only very low to non-detectable amounts of organic components, reducing the likelihood of severe aquifer contamination

# Task 6: Technology Transfer

**Project website:**

**geology.utah.gov/emp/UBwater\_study**

## Uinta Basin Water Study

**Water-Related Issues Affecting Conventional Oil and Gas Recovery and Potential Oil Shale Development in the Uinta Basin, Utah**

Funded by National Energy Technology Laboratory

Goal || Topics || Publications  
Presentations || References || Links || Contact

### Overall Goal

This Uinta Basin water study will help alleviate problems associated with produced saline water as a means to facilitate increased conventional hydrocarbon production and help resolve water-related environmental barriers to possible oil shale development.

- [Project Summary](#) (pdf - updated July 2010)
- [Project Overview Presentation](#) (pdf) - NETL Project Kickoff Meeting, 12/08
- [Proposal](#) (pdf)

### Topics

- Moderately Saline Aquifer Study

Goal: Re-map the base of moderately saline water in the Uinta Basin to better facilitate water disposal permitting and to protect fresh-water resources.

#### SALINE WATER DISPOSAL IN THE UINTA BASIN, UTAH

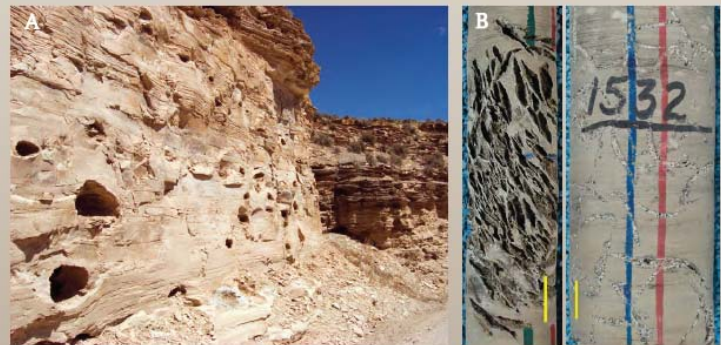

PROTECTING FRESH WATER WHILE ALLOWING FOR INCREASED HYDROCARBON PRODUCTION

by Michael D. Vanden Berg

Saline water disposal is one of the most pressing issues with regard to increasing crude oil and natural gas production in the Uinta Basin of northeastern Utah. Conventional oil fields in the basin provide 67 percent of Utah's total crude oil production and 70 percent of Utah's total natural gas, the latter of which has increased 60 percent in the past 10 years. Along with hydrocarbons, wells in the Uinta Basin produce significant amounts of salty water—nearly 4 million barrels of saline water per month in Uintah County and nearly 2 million barrels per month in Duchesne County. As hydrocarbon production increases, so does saline water production, creating an increased need for economic and environmentally responsible disposal plans. Current water disposal wells—wells specifically used to re-inject saline water underground—are near capacity, and permitting for new wells is being delayed because of a lack of technical data regarding potential disposal aquifers and questions concerning contamination of freshwater sources. Many companies are reluctantly resorting to evaporation ponds as a short-term solution, but these ponds have limited capacity, are prone to leakage, and pose potential risks to birds and other wildlife. Many Uinta Basin operators claim that oil and natural gas production cannot

The Birds Nest aquifer in the eastern Uinta Basin is a promising reservoir for the disposal of saline water that accompanies hydrocarbon production.

A) Birds Nest aquifer in outcrop along Evacuation Creek, eastern Uinta Basin. The large cavities resulted from the dissolution of saline minerals, creating the aquifer's porosity (percent of pore space) and permeability (a measure of how effectively the pores are connected). B) Dissolution of saline minerals in core from central Uintah County (yellow bars equal 1 inch).

## WATER-RELATED ISSUES AFFECTING CONVENTIONAL OIL AND GAS RECOVERY AND POTENTIAL OIL SHALE DEVELOPMENT IN THE UINTA BASIN, UTAH

FUNDED BY: U.S. DEPARTMENT OF ENERGY - NATIONAL ENERGY TECHNOLOGY LABORATORY

GEOLOGY.UTAH.GOV/EMP/UWATER\_STUDY

### Objectives

To evaluate the water-related issues affecting oil and gas recovery in the Uinta Basin, Utah, and to identify potential water-related issues that may affect oil and gas recovery in the future.

### Goals

- Characterize the water-related issues in the Uinta Basin, Utah.
- Assess the potential for water-related issues to affect oil and gas recovery in the future.
- Identify the water-related issues that may affect oil and gas recovery in the future.

### Project Tasks

- Survey the water-related issues in the Uinta Basin, Utah, and identify the water-related issues that may affect oil and gas recovery in the future.
- Assess the potential for water-related issues to affect oil and gas recovery in the future.
- Identify the water-related issues that may affect oil and gas recovery in the future.

## MODERATELY SALINE GROUNDWATER STUDY

### Predicts

- How deep the water table is in the Uinta Basin, Utah, and how deep the water table is in the future.
- How deep the water table is in the Uinta Basin, Utah, and how deep the water table is in the future.
- How deep the water table is in the Uinta Basin, Utah, and how deep the water table is in the future.

Map of the Uinta Basin, Utah, showing the water table depth in the future.

## GEOLOGIC CHARACTERIZATION OF THE BIRD'S NEST AQUIFER

### Predicts

- How deep the water table is in the Bird's Nest Aquifer, Utah, and how deep the water table is in the future.
- How deep the water table is in the Bird's Nest Aquifer, Utah, and how deep the water table is in the future.
- How deep the water table is in the Bird's Nest Aquifer, Utah, and how deep the water table is in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

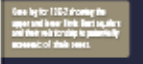

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

Geologic map of the Bird's Nest Aquifer, Utah, showing the water table depth in the future.

## BASELINE WATER-QUALITY DATABASE FOR LANDS WITH OIL SHALE DEVELOPMENT POTENTIAL

### Predicts

- How deep the water table is in the lands with oil shale development potential, Utah, and how deep the water table is in the future.
- How deep the water table is in the lands with oil shale development potential, Utah, and how deep the water table is in the future.
- How deep the water table is in the lands with oil shale development potential, Utah, and how deep the water table is in the future.

Map of the lands with oil shale development potential, Utah, showing the water table depth in the future.

### Quarterly reports, annual review meetings, etc.

Quarterly reports emailed to ~80 interested individuals from private and public sectors

#### October 2009 – Year 1 review meeting

- Vernal, UT
- 16 participants

#### January 2011 – Year 2 review meeting

- Vernal, UT
- 33 participants

Final results will be presented at AAPG national meeting – April 2012

## Oil & Natural Gas Technology

DOE Award No.: DE-NT0005671

### Quarterly Report

October 2011 - December 2011

**Water-related Issues Affecting Conventional Oil and Gas Recovery and Potential Oil-Shale Development in the Uinta Basin, Utah**

Submitted by:  
Utah Geological Survey  
P.O. Box 146100  
Salt Lake City, UT 84114-6100

Principal Investigator: Michael D. Vanden Berg

Prepared for:  
United States Department of Energy  
National Energy Technology Laboratory

January 31, 2012

Office of Fossil Energy

### Fieldtrips – Discussed project at Birds Nest outcrop along Evacuation Creek

- May 2009 – University of Utah Uinta Basin field trip
- October 2010 – 30<sup>th</sup> Oil Shale Symposium
- November 2010 – UGS board field trip
- May 2011 – University of Utah Unconventional Fuels Conference
- October 2011 – 31<sup>st</sup> Oil Shale Symposium

**Is it really over.....  
..... any more questions**

## **Hazards of doing fieldwork in the Uinta Basin**
